Features

- Fast Read Access Time 90 ns
- Dual Voltage Range Operation

Unregulated Battery Power Supply Range, 2.7V to 3.6V or Standard 5V \pm 10% Supply Range

- Pin Compatible with JEDEC Standard AT27C512
- Low Power CMOS Operation

20 μ A max. (less than 1 μ A typical) Standby for V_{CC} = 3.6V 29 mW max. Active at 5 MHz for V_{CC} = 3.6V

• JEDEC Standard Surface Mount Packages

32-Lead PLCC

28-Lead 330-mil SOIC

28-Lead TSOP

High Reliability CMOS Technology

2,000V ESD Protection

200 mA Latchup Immunity

- Rapid[™] Programming Algorithm 100 µs/byte (typical)
- CMOS and TTL Compatible Inputs and Outputs

JEDEC Standard for LVTTL and LVBO

- Integrated Product Identification Code
- Commercial and Industrial Temperature Ranges

Description

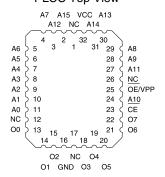

The AT27BV512 is a high performance, low power, low voltage 524,288 bit one-time programmable read only memory (OTP EPROM) organized as 64K by 8 bits. It requires only one supply in the range of 2.7V to 3.6V in normal read mode operation, making it ideal for fast, portable systems using either regulated or unregulated battery power.

Atmel's innovative design techniques provide fast speeds that rival 5V parts while keeping the low power consumption of a 3V supply. At $V_{CC}=2.7V$, any byte can be accessed in less than 90 ns. With a typical power consumption of only 18 mW at 5 MHz and $V_{CC}=3V$, the AT27BV512 consumes less than one fifth the power of a standard 5V EPROM.

Pin Configurations

Pin Name	Function
A0 - A15	Addresses
O0 - O7	Outputs
CE	Chip Enable
OE/V _{PP}	Output Enable

Description (Continued)

Standby mode supply current is typically less than 1 μ A at 3V. The AT27BV512 simplifies system design and stretches battery lifetime even further by eliminating the need for power supply regulation.

The AT27BV512 is available in industry standard JEDEC-approved one-time programmable (OTP) plastic PLCC, SOIC, and TSOP packages. All devices feature two-line control (CE, OE) to give designers the flexibility to prevent bus contention.

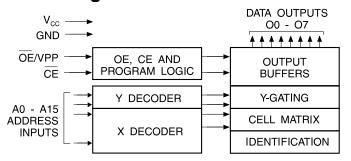

The AT27BV512 operating with V_{CC} at 3.0V produces TTL level outputs that are compatible with standard TTL logic devices operating at V_{CC} = 5.0V. At V_{CC} = 2.7V, the part is compatible with JEDEC approved low voltage battery operation (LVBO) interface specifications. The device is also capable of standard 5-volt operation making it ideally suited for dual supply range systems or card products that are pluggable in both 3-volt and 5-volt hosts.

Atmel's AT27BV512 has additional features to ensure high quality and efficient production use. The Rapid[™] Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μs/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27BV512 programs exactly the same way as a standard 5V AT27C512R and uses the same programming equipment.

System Considerations

Switching between active and standby conditions via the Chip Enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed data sheet limits, resulting in device non-conformance. At a minimum, a 0.1 μF high frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the VCC and Ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 μF bulk electrolytic capacitor should be utilized, again connected between the VCC and Ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

Block Diagram

Absolute Maximum Ratings*

Temperature Under Bias40°C to +85°C
Storage Temperature65°C to +125°C
Voltage on Any Pin with Respect to Ground2.0V to +7.0V (1)
Voltage on A9 with Respect to Ground2.0V to +14.0V (1)
V _{PP} Supply Voltage with Respect to Ground2.0V to +14.0V ⁽¹⁾

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is V_{CC} + 0.75V dc which may be exceeded if certain precautions are observed (consult application notes) and which may overshoot to +7.0V for pulses of less than 20 ns.

Operating Modes

Mode \ Pin	CE	OE/V _{PP}	Ai	Vcc	Outputs
Read ⁽²⁾	VIL	VIL	Ai	Vcc (2)	Dout
Output Disable (2)	VIL	ViH	X ⁽¹⁾	Vcc (2)	High Z
Standby ⁽²⁾	VIH	Х	Х	Vcc (2)	High Z
Rapid Program (3)	VIL	V _{PP}	Ai	Vcc (3)	D _{IN}
PGM Verify (3)	VIL	VIL	Ai	Vcc (3)	Dout
PGM Inhibit (3)	VIH	Vpp	Χ	Vcc (3)	High Z
Product Identification (3, 5)	VIL	VIL	A9 = VH ⁽⁴⁾ A0 = V _{IH} or V _{IL} A1 - A15 = V _{IL}	Vcc (3)	Identification Code

Notes: 1. X can be V_{IL} or V_{IH}.

- 2. Read, output disable, and standby modes require, $2.7V \le V_{CC} \le 3.6V$, or $4.5V \le V_{CC} \le 5.5V$.
- Refer to Programming Characteristics.
 Programming modes require V_{CC} = 6.5V.
- 4. $V_H = 12.0 \pm 0.5 V$.
- Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

Notes: 2, 3, 4, 5. - see AC Waveforms for Read Operation.

AC Waveforms for Read Operation (1)

- Notes: 1. Timing measurement references are 0.8V and 2.0V. Input AC drive levels are 0.45V and 2.4V, unless otherwise specified.
 - 2. OE/V_{PP} may be delayed up to t_{CE} t_{OE} after the falling edge of CE without impact on t_{CE}.
 - 3. OE/V_{PP} may be delayed up to t_{ACC} t_{OE} after the address is valid without impact on t_{ACC}.
- 4. This parameter is only sampled and is not 100% tested.
- Output float is defined as the point when data is no longer driven.
- 6. When reading the 27BV512, a 0.1 μF capacitor is required across V_{CC} and grond to supress spurious voltage transients.

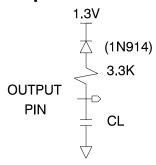

Input Test Waveform and Measurement Level

AC DRIVING LEVELS 0.45V 2.0 AC MEASUREMENT LEVEL

Atmel's 27BV512 Integrated (1) Product Identification Code

		Pins						Hex		
Codes	Α0	07	O6	O5	04	О3	O2	O1	00	Data
Manufacturer	0	0	0	0	1	1	1	1	0	1E
Device Type	1	0	0	0	0	1	1	0	1	0D

Note:

1. The AT27BV512 has the same Product Identification Code as the AT27C512R. Both are programming compatible.

Rapid Programming Algorithm

A 100 μs CE pulse width is used to program. The address is set to the first location. Vcc is raised to 6.5V and OE/VPP is raised to 13.0V. Each address is first programmed with one 100 µs CE pulse without verification. Then a verification / reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 µs pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. OE/VPP is then lowered to V_{IL} and V_{CC} to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.
