13-input parity checker/generator

DESCRIPTION

The HEF4531B is a parity checker/generator with 13 parity inputs (I_0 to I_{12}) and a parity output (O). When the number of parity inputs that are HIGH is even, the output is LOW. When the number of parity inputs that are HIGH is odd, the output is HIGH. For words of 12 bits or less, the output can be used to generate either odd or even parity by appropriate termination of the unused parity input(s). For words of 14 or more bits, the devices can be cascaded by connecting the output of one device to any parity input of another device. When cascading devices, it is recommended that the output of one device be connected to the I_{12} input of the other device since there is less delay to the output from the I_{12} input than from any other input (I_0 to I_{11}).
