M52340SP

PAL/NTSC SYSTEM SHINGLE-CHIP COLOR TV SIGNAL PROCESSOR

DESCRIPTION

The M52340SP is a single-chip semiconductor integrated circuit to process signals of a color TV. Circuits to process video IF, sound IF, video, color, and deflection signals, a I^2C bus control circuit, and D/A are build in this device.

This IC can be used not only for popular-type TV sets but also for middle-class TV sets. Combined with a SECAM chroma decoder, the M52325AP, this device can process signals of every type of TVs in the world by discriminating them fully automatically.

FEATURES

- •A built-in I^2C bus control circuit makes it possible to reduce the number of peripheral parts and rationalize production lines.
- •Various filters (TRAP, BPF, Y-DL, RGB clamp) are build in this IC.
- •PLL detection system is introduced to process video IF and voice IF. Furthermore, AFT coil is not necessary.
- •DL aperture control
- •Color signal frequency and vertical frequency of TVs of every type can be discriminated fully automatically.
- •Horizontal/vertical countdown system
- •V-pulse output
- •RGB output
