

## TDMA ANTENNA SWITCH GaAs MMIC

### ■GENERAL DESCRIPTION

NJG1515AVB2 is an antenna switch IC for a digital cellular phone of 800MHz and 1.5GHz band.

The parallel control signals of three bits connect T/R circuits to internal two antennas or external two antennas.

The termination ports with external matching circuits make low interference between diversity antennas.

NJG1515AVB2 features very low insertion loss and low current consumption in a very small SSOP20 package.

## ■ TERMINAL INFORMATION

PIN NO.	SYMBOL	DESCRIPTIONS
1	CTL2	High-impedance C-MOS input terminal. This terminal is set to High-Level by $2V \sim V_{DD}$ , and Low-Level by $+0.6V \sim 0V$ . In case of open or unstable level, connect this terminal by $100K\Omega$ resistor with GND terminal or $V_{DD}$ terminal.
2	CTL3	High-impedance C-MOS input terminal. This terminal is set to High-Level by $2V \sim V_{DD}$ , and Low-Level by $+0.6V \sim 0V$ . In case of open or unstable level, connect this terminal by $100K\Omega$ resistor with GND terminal or $V_{DD}$ terminal.
3	$V_{SS}$	Negative voltage supply terminal. The negative voltage ( $-3.5 \sim -2.0V$ ) have to be supplied on transmitting. Otherwise negative voltage of $-2.5 \sim 0V$ can be used or this terminal can be stayed open, because internal level of this terminal is automatically set to GND level on receiving. The bypass capacitor have to be connected with GND terminal for excellent RF performance.
4	EXT2	RF receiving port. An external capacitor of $56pF \sim 100pF$ is required to block DC voltage ( $V_{DD}$ ).
6	EXT1	RF transmitting/receiving port. An external capacitor of $56pF \sim 100pF$ is required to block DC voltage ( $V_{DD}$ ).
8	TX	RF transmitting port. An external capacitor of $56pF \sim 100pF$ is required to block DC voltage ( $V_{DD}$ ).
10	TER2	ANT1 termination port. The influence of ANT1 port to ANT2 port is suppressed by terminating this port by an appropriate termination. An external capacitor ( $5pF$ ) is required to block DC voltage ( $V_{DD}$ ).
11	ANT1	RF transmitting/receiving port. An external capacitor of $56pF \sim 100pF$ is required to block DC voltage ( $V_{DD}$ ).
13	RX	RF receiving port. An external capacitor of $56pF \sim 100pF$ is required to block DC voltage ( $V_{DD}$ ).
15	ANT2	RF receiving port. An external capacitor of $56pF \sim 100pF$ is required to block DC voltage ( $V_{DD}$ ).
17	TER1	ANT2 termination port. The influence of ANT2 port to ANT1 port is suppressed by terminating this port with appropriate termination. An external capacitor ( $5pF$ ) is required to block DC voltage ( $V_{DD}$ ).
19	$V_{DD}$	Positive voltage supply terminal. The positive voltage ( $2.7 \sim 5.0V$ ) have to be supplied. The bypass capacitor have to be connected with GND terminal for excellent RF performance.
20	CTL1	High-impedance C-MOS input terminal. This terminal is set to High-Level by $2V \sim V_{DD}$ , and Low-Level by $+0.6 \sim 0V$ . In case of open or unstable level, connect this terminal by $100k\Omega$ resistor with GND terminal or $V_{DD}$ terminal.
5,7,9,12, 14,16,18	GND	Ground terminal. Please connect this terminal with ground plane as close as possible for excellent RF performance.
