PICTURE-IN-PICTURE  
SIGNAL PROCESSING

## DESCRIPTION

The M65669SP/FP is a PIP (Picture in Picture) signal processing LSI, whose sub-picture input is composite signal for NTSC, PAL-M, and PAL-N. The built-in field memory (144k-bit RAM) , V-chip data slicer and analog circuitries lead the high quality PIP system low cost and small size.

## FEATURES

- \* Built-in 144k-bit field memory ( sub-picture data storage)
- \* Internal V-chip data slicer (for sub-picture)
- \* Vertical filter for sub-picture ( Y signal )
- \* Single sub-picture ( selectable picture size : 1/9 , 1/16 )
- \* Sub-picture processing specification ( 1/9 , 1/16 size ) :
  - Quantization bits    Y, B-Y, R-Y : 6 bits
  - Horizontal sampling    229 pixels ( Y ) , 57 pixels ( B-Y, R-Y )
  - Vertical lines        69/ 52 lines
- \* Frame ( sub-picture ) on/off
- \* Built-in analog circuits :
  - One 8-bit A/D converter ( for sub-picture signal)
  - Three 8-bit D/A converters ( for Y, U and V of sub-picture )
  - Sync-tip-clamp, VCXO ... etc..
- \* IIC BUS control ( parallel/serial control ) :
  - PIP on/off , Frame on/off ( programmable luma level),
  - Sub-picture size ( 1/9, 1/16 ) ,
  - PIP position ( free position ) , Picture freeze ,
  - Y delay adjustment, Chroma level, Tint, Black level,
  - Contrast        ...etc..

## APPLICATION

NTSC, PAL-M, PAL-N color TV

## RECOMMENDED OPERATING CONDITIONS

Supply voltage range	-----	3.1 ~ 3.5 V
Operating frequency	-----	14.32 MHz
Operating temperature	-----	-10 ~ 70 deg.
Input voltage (CMOS interface)	"H" ----- VDD x 0.7 ~ VDD V	
	"L" -----	0 ~ VDD x 0.3 V
Output current ( output buffer )	-----	4 mA ( MAX )
Output load capacitance	-----	20 pF ( MAX ) *1
Circuit current	-----	- mA

NOTICE: Connect a 0.1µF or larger capacitor between VDD and VSS pins.  
\*1 : Include pin capacitance ( 7 pF )

**<Driving Method and Operating Specification for Serial Interface Data>****(1) Serial data transmission completion and start**

A low-to-high transition of the DATA (serial data) line while the CLK (serial clock) is high, that completes the serial transmission and makes the bus free.

A high-to-low transition of the DATA line while the CLK is high, that starts the serial transmission and waits for the following CLK and DATA inputs.

**(2) Serial data transmission**

The data are transmitted in the most significant bit (MSB) first by one-byte unit on the DATA line successively. One-byte data transmission is completed by 9 clock cycles, the former 8 cycles are for address/data and the latter one is for acknowledge detection. (In reading state, ACK is 'H' under these two conditions ; 1) the coincidence of two address data for the address data transmission, 2) the completion of 8-bit setting data transfer. In writing state, ACK is 'H' with the address coincidence and ACK is 'L' for detecting acknowledge input from the master (micro processor) after sending 8-bit setting data.)

For address/data transmission, DATA must change while CLK is 'L'. (The data change while CLK is 'H' or the simultaneous change of CLK and DATA, that will be a false operation because of undistinguished condition from the completion/start of serial data transfer).

After the beginning of serial data transmission, the total number of data bytes that can be transferred are not limited.

**(3) The byte format of data transmission (The sequence of data transmission)****a. The byte format during data setting to M65669FP are shown as follows.**

In right after the forming of serial data transmitting state, the slave address 24h (00100100b) is transferred. Afterwards, the internal register address (1 byte) and setting data (by 1 byte unit) are transferred successively. Several bytes of setting data can be handled in the one transmission. In this operation, the setting data are written into the address register whose address is increased one in initially transferred internal register address.

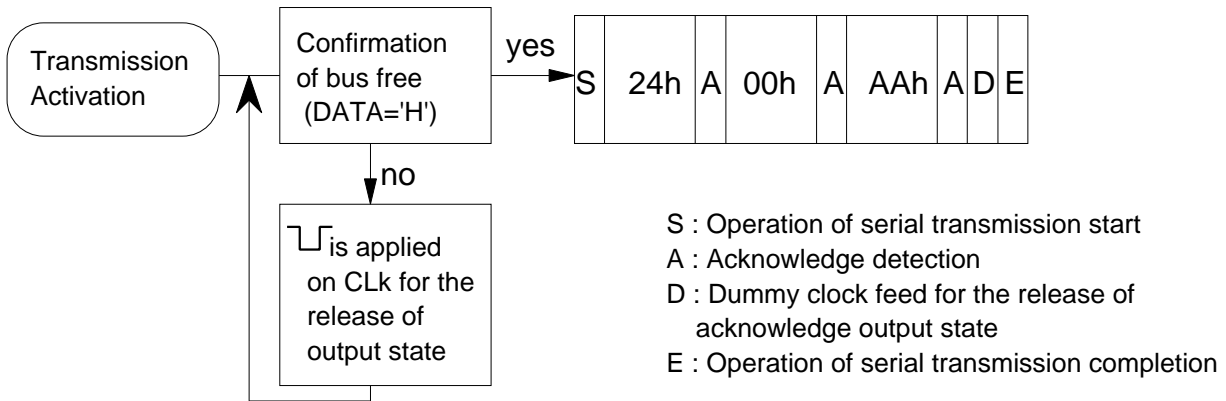

**b. The byte format during data reading from M65669FP are shown as follows.**

Before data reading from M65669FP, whose internal address need to be set by the data reading/transmitting. After the data reading/transmitting, the operation of "serial data transmission completion and start" (described in (1)) is necessary. Continuously, the slave address 25h (00100101b) is sent, and then the inverted read out data are available on ACK. Several bytes of writing data can be handled in the one transmission, too. In this operation, the setting data also are written into the address register whose address is increased one in initially transferred internal register address.
