

Dual Power Distribution Controller

The ISL6161 is a HOT SWAP dual supply power distribution controller that can be used in PCI-Express applications.

Two external N-Channel MOSFETs are driven to distribute and control power while providing load fault isolation. At turn-on, the gate of each external N-Channel MOSFET is charged with a 10 μ A current source. Capacitors on each gate (see the Typical Application Diagram), create a programmable ramp (soft turn-on) to control inrush currents. A built in charge pump supplies the gate drive for the 12V supply N-Channel MOSFET switch.

Over current protection is facilitated by two external current sense resistors and FETs. When the current through either resistor exceeds the user programmed value the controller enters the current regulation mode. The time-out capacitor, C_{TIM}, starts charging as the controller enters the time out period. Once C_{TIM} charges to a 2V threshold, both the N-Channel MOSFETs are latched off. In the event of a hard and fast fault of at least three times the programmed current limit level, the N-Channel MOSFET gates are pulled low immediately before entering the time out period. The controller is reset by a rising edge on the ENABLE pin.

The ISL6161 constantly monitors both output voltages and reports either one being low on the PGOOD output as a low. The 12V PGOOD V_{th} is 10.8V and the 3.3V V_{th} is 2.8V nominally.

Features

- HOT SWAP Dual Power Distribution and Control for +12V and +3.3V
- Provides Fault Isolation
- Programmable Current Regulation Level
- Programmable Time Out
- Charge Pump Allows the Use of N-Channel MOSFETs
- Power Good and Over Current Latch Indicators
- Adjustable Turn-On Ramp
- Protection During Turn-On
- Two Levels of Current Limit Detection Provide Fast Response to Varying Fault Conditions
- 1 μ s Response Time to Dead Short
- 3 μ s Response Time to 200% Current Overshoot

Applications

- PCI-Express Applications
- Power Distribution and Control
- Hot Plug, Hot Swap Components

ISL6161

Pin Descriptions

PIN #	SYMBOL	FUNCTION	DESCRIPTION
1	12VS	12V Source	Connect to source of associated external N-Channel MOSFET switch to sense output voltage.
2	12VG	12V Gate	Connect to the gate of associated N-Channel MOSFET switch. A capacitor from this node to ground sets the turn-on ramp. At turn-on this capacitor will be charged to 17.4V by a 10 μ A current source. A small resistor (10 - 200 Ω) should be placed in series with the gate capacitor to ground to prevent current oscillations.
3	V _{DD}	Chip Supply	Connect to 12V supply. This can be either connected directly to the +12V rail supplying the load voltage or to a dedicated V _{DD} +12V supply. If the former is chosen special attention to V _{DD} decoupling must be paid.
4	NC	Not Connected	
5	$\overline{\text{ENABLE}}$	Enable / Reset	$\overline{\text{ENABLE}}$ is used to turn-on and reset the chip. Both outputs turn-on when this pin is driven low. After a current limit time out, the chip is reset by the rising edge of a reset signal applied to the $\overline{\text{ENABLE}}$ pin. This input has 100 μ A pull up capability which is compatible with 3V and 5V open drain and standard logic.
6	3VG	3V Gate	Connect to the gate of the external 3V N-Channel MOSFET. A capacitor from this node to ground sets the turn-on ramp. At turn-on this capacitor will be charged to 11.4V by a 10 μ A current source. A small resistor (10 - 200 Ω) should be placed in series with the gate capacitor to ground to prevent current oscillations.
7	3VS	3 Source	Connect to the source side of 3V external N-Channel MOSFET switch to sense output voltage.
8	3VISEN	3V Current Sense	Connect to the load side of the 3V sense resistor to measure the voltage drop across this resistor between 3VS and 3VISEN pins.
9	PGOOD	Power Good indicator	Indicates that all output voltages are within specification. PGOOD is driven by an open drain N-Channel MOSFET. It is pulled low when any output is not within specification.
10	C _{TIM}	Current Limit Timing Capacitor	Connect a capacitor from this pin to ground. This capacitor controls the time between the onset of current limit and chip shutdown (current limit time-out). The duration of current limit time-out (in seconds) = 200k Ω x C _{TIM} (Farads).
11	C _{PUMP}	Charge Pump Capacitor	Connect a 0.1 μ F capacitor between this pin and V _{DD} (pin3). Provides charge storage for 12VG drive
12	GND	Chip Ground	
13	R _{ILIM}	Current Limit Set Resistor	A resistor connected between this pin and ground determines the current level at which current limit is activated. This current is determined by the ratio of the R _{ILIM} resistor to the sense resistor (R _{SENSE}). The current at current limit onset is equal to 10 μ A x (R _{ILIM} /R _{SENSE}). The ISL6161 is limited to a 10k Ω min. value (OC V _{th} = 100mV) resistor whereas the ISL6161 can accommodate a 5k Ω resistor for a lower OC V _{th} (50mV).
14	12VISEN	12V Current Sense	Connect to the load side of sense resistor to measure the voltage drop across this resistor.

Absolute Maximum Ratings $T_A = 25^{\circ}\text{C}$

V_{DD}	-0.3V to +16V
12VG, C_{PUMP}	-0.3V to 21V
12VISEN, 12VS	-5V to $V_{DD} + 0.3\text{V}$
3VISEN, 3VS	-5V to 7.5V
PGOOD, R_{ILIM}	-0.3V to 7.5V
ENABLE, C_{TIM} , 3VG	-0.3V to $V_{DD} + 0.3\text{V}$
ESD Classification	2kV (Class 2)

Thermal Information

Thermal Resistance (Typical, Note 1)	θ_{JA} ($^{\circ}\text{C}/\text{W}$)
SOIC Package	67
Maximum Junction Temperature (Plastic Package)	150 $^{\circ}\text{C}$
Maximum Storage Temperature Range	-65 $^{\circ}\text{C}$ to 150 $^{\circ}\text{C}$
Maximum Lead Temperature (Soldering 10s)	300 $^{\circ}\text{C}$ (SOIC - Lead Tips Only)

Operating Conditions

V_{DD} Supply Voltage Range	+10.5V to +13.2
Temperature Range (T_A)	0 $^{\circ}\text{C}$ to 70 $^{\circ}\text{C}$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

1. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
2. All voltages are relative to GND, unless otherwise specified.

Electrical Specifications $V_{DD} = 12\text{V}$, $C_{VG} = 0.01\mu\text{F}$, $C_{TIM} = 0.1\mu\text{F}$, $R_{SENSE} = 0.1\Omega$, $C_{BULK} = 220\mu\text{F}$, $\text{ESR} = 0.5\Omega$, $T_A = T_J = 0^{\circ}\text{C}$ to 70 $^{\circ}\text{C}$, Unless Otherwise Specified

ISL6161 Description and Operation

The ISL6161 is a multi featured +12V and +3.3V dual power supply distribution controller, features include programmable current limiting regulation and time to latch off.

With the \overline{ENABLE} internal pull-up the ISL6161 is well suited for implementation on either side of the connector where a motherboard prebiased condition or a load board staggered connection is present. In either case the ISL6161 turns on in a soft start mode protecting the supply rail from sudden current loading.

At turn-on, the gate capacitor of each external N-Channel MOSFET is charged with a $10\mu A$ current source. These capacitors create a programmable ramp (soft turn-on). A charge pump supplies the gate drive for the 12V supply control FET switch driving that gate to 17V.

The load currents pass through two external current sense resistors. When the voltage across either resistor exceeds the user programmed Over Current (OC) voltage threshold value,

(see Table 1) the controller enters current regulation. The OC Vth is set by the external resistor value on R_{ILIM} pin. At this time the time-out capacitor, C_{TIM} , starts charging with a $10\mu A$ current source and the controller enters the time out period. The length of the time out period is set by the single external capacitor (see Table 2) placed from the C_{TIM} pin (pin 10) to ground and is characterized by a lowered gate drive voltage to the appropriate external N-Channel MOSFET. Once C_{TIM} charges to 2V, an internal comparator is tripped resulting in both N-Channel MOSFETs being latched off.

TABLE 1.

R_{ILIM} RESISTOR	NOMINAL OC VTH
10k Ω	100mV
7.5k Ω	75mV
4.99k Ω	50mV

NOTE: Nominal OC Vth = $R_{ilim} \times 10\mu A$.

TABLE 2.

C _{TIM} CAPACITOR	NOMINAL TIME OUT PERIOD
0.022μF	4.4ms
0.047μF	9.4ms
0.1μF	20ms

NOTE: Nominal time-out period in seconds = C_{TIM} × 200kΩ.

The ISL6161 responds to a load short (defined as a current level 3X the OC set point) immediately, driving the relevant N-Channel MOSFET gate to 0V in less than 1μs. The gate voltage is then slowly ramped up turning on the N-Channel MOSFET to the programmed current limit level, this is the start of the time out period. The programmed current level is held until either the OC event passes or the time out period expires. If the former is the case then the N-Channel MOSFET is fully enhanced and the C_{TIM} charging current is diverted away from the capacitor. If the time out period expires prior to OC resolution then both gates are quickly pulled to 0V turning off both N-Channel MOSFETs simultaneously.

Upon any OC or UV condition the PGOOD signal will pull low when tied high through a resistor to the logic supply. This pin is a fault indicator but not the OC latch off indicator. For an OC latch off indication, monitor CTIM, pin 10. This pin will rise rapidly to 12V once the time out period expires. See block diagram for OC latch off circuit suggestion.

The ISL6161 is reset by a rising edge on the ENABLE pin and is turned on by the ENABLE pin being driven low.

ISL6161 Application Considerations

Current loop stabilization is facilitated through a small value resistor in series with the gate timing capacitor. As the ISL6161 drives a highly inductive current load, instability characterized by the gate voltage repeatedly ramping up and down may appear. A simple method to enhance stability is provided by the substitution of a larger value gate resistor. Typically this situation can be avoided by eliminating long point to point wiring to the load.

During the **Time Out delay period** with the ISL6161 in current limit mode, the V_{GS} of the external N-Channel MOSFETs is reduced driving the N-Channel MOSFET switch into a high r_{DS(ON)} state. Thus avoid extended time out periods as the external N-Channel MOSFETs may be damaged or destroyed due to excessive internal power dissipation. Refer to the MOSFET manufacturers data sheet for SOA information.

With the high levels of inrush current e.g., highly capacitive loads and motor start up currents, **choosing the current limiting level** is crucial to provide both protection and still allow for this inrush current without latching off. Consider this in addition to the time out delay when choosing MOSFETs for your design.

Physical layout of Rsense resistors is critical to avoid the possibility of false over current occurrences. Ideally trace routing between the Rsense resistors and the ISL6161 is direct and as short as possible with zero current in the sense lines.

FIGURE 1. SENSE RESISTOR PCB LAYOUT

Open load detection can be accomplished by monitoring the ISEN pins. Although gated off the external FET I_{DSS} will cause the ISEN pin to float above ground to some voltage when there is no attached load. If this is not desired 5k resistors from the xISEN pins to ground will prevent the outputs from floating when the external switch FETs are disabled and the outputs are open.

For **PCI-Express applications** the ISL6161 and the ISL6118 provide the fundamental hotswap function for the +12V & +3.3V main rails and the +3.3V aux respectively as shown in Figure 13.

Small Outline Plastic Packages (SOIC)

NOTES:

- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
- The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
- Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
