CMOS DUAL-PORT RAM
8K (1K x 8-BIT)
IDT7130SA/LA
IDT7140SA/LA

T-46-23-12

FEATURES

- High-speed access
 - Military: 25/30/35/45/55/70/90/100/120ns (max.)
 - Commercial: 20/25/30/35/45/55/70/90/100ns (max.)
- Low-power operation
 - IDT7130/IDT7140SA
 - Active: 325mW (typ.)
 - Standby: 5mW (typ.)
 - IDT7130/IDT7140LA
 - Active: 325mW (typ.)
 - Standby: 1mW (typ.)
- MASTER IDT7130 easily expands data bus width to 16-or-more-bits using SLAVE IDT7140
- On-chip port arbitration logic (IDT7130 Only)
- **BUSY** output flag on IDT7130; **BUSY** input on IDT7140
- **INT** flag for port-to-port communication
- Fully asynchronous operation from either port
- Battery backup operation—2V data retention
- TTL-compatible, single 5V $\pm 10\%$ power supply
- Military product compliant to MIL-STD-883, Class B
- Standard Military Drawing #5962-86875
- Industrial temperature range (-40°C to +85°C) is available, tested to military electrical specifications

DESCRIPTION

The IDT7130/IDT7140 are high speed 1K x 8 dual-port static RAMs. The IDT7130 is designed to be used as a stand-alone 8-bit dual-port RAM or as a "MASTER" dual-port RAM together with the IDT7140 "SLAVE" dual-port in 16-bit-or-more word width systems. Using the IDT MASTER/SLAVE dual-port RAM approach in 16-or-more-bit memory system applications results in full-speed, error-free operation without the need for additional discrete logic.

Both devices provide two independent ports with separate control, address, and I/O pins that permit independent asynchronous access for reads or writes to any location in memory. An automatic power down feature, controlled by $\overline{CE}$, permits the on chip circuitry of each port to enter a very low standby power mode.

Fabricated using IDT's CEMOS™ high-performance technology, these devices typically operate on only 325mW of power at maximum access times as fast as 20ns. Low-power (LA) versions offer battery backup data retention capability, with each dual-port typically consuming 200μW from a 2V battery.

The IDT7130/IDT7140 devices are packaged in 48-pin sidebrase or plastic DIPs, 48- or 52-pin LCCs, 52-pin PLCCs, and 48-Lead flatpacks. Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B.

FUNCTIONAL BLOCK DIAGRAM**NOTES:**

1. IDT7130 (MASTER): **BUSY** is open drain output and requires pullup resistor.
2. IDT7140 (SLAVE): **BUSY** is input.
3. Open drain output; requires pullup resistor.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Rating	Commercial	Military	Unit
V _{TERM} ⁽²⁾	Terminal Voltage with Respect to GND	-0.5 to +7.0	-0.5 to +7.0	V
T _A	Operating Temperature	0 to +70	-55 to +125	°C
T _{BIAS}	Temperature Under Bias	-55 to +125	-65 to +135	°C
T _{STG}	Storage Temperature	-55 to +125	-65 to +150	°C
I _{OUT}	DC Output Current	50	50	mA

2689 tbl 01

NOTE:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{TERM} must not exceed V_{CC} + 0.5V.

RECOMMENDED
DC OPERATING CONDITIONS

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{CC}	Supply Voltage	4.5	5.0	5.5	V
GND	Supply Voltage	0	0	0	V
V _{IH}	Input High Voltage	2.2	—	6.0 ⁽²⁾	V
V _{IL}	Input Low Voltage	-0.5 ⁽¹⁾	—	0.8	V

NOTE:

- V_{IL} (min.) = -3.0V for pulse width less than 20ns.
- V_{TERM} must not exceed V_{CC} + 0.5V.

2689 tbl 02

RECOMMENDED OPERATING
TEMPERATURE AND SUPPLY VOLTAGE

Grade	Ambient Temperature	GND	V _{CC}
Military	-55°C to +125°C	0V	5.0V ± 10%
Commercial	0°C to +70°C	0V	5.0V ± 10%

NOTES:

- "x" in part numbers indicates power rating (SA or LA).
- 0°C to +70°C temperature range only.
- 55°C to +125°C temperature range only.
- At f = f_{MAX}, address and control lines (except Output Enable) are cycling at the maximum frequency read cycle of 1/t_{RC}, and using "AC TEST CONDITIONS" of Input levels of GND to 3V.
- f = 0 means no address or control lines change. Applies only to inputs at CMOS level standby.
- Not available in DIP packages, see 7030/40 data sheet.
- DIP packages for 0°C to +70°C only, see 7030/40 data sheet.
- V_{CC} = 5V, T_A = +25°C for Typ.
- At V_{CC} ≤ 2.0V input leakages are undefined.

2. 0°C to $+70^\circ\text{C}$ temperature range only.
3. -55°C to $+125^\circ\text{C}$ temperature range only.
4. This parameter guaranteed but not tested.
5. For MASTER/SLAVE combination, $tWC = tBAA + tWP$.
6. Specified for OE at high (Refer to "Timing Waveform of Write Cycle", Note 7).
7. "X" in part numbers indicates power rating (SA or LA).
8. Not available in DIP packages, see 7030/40 data sheet.
9. DIP packages for 0°C to $+70^\circ\text{C}$ only, see 7030/40 data sheet.

CAPACITANCE ($T_A = +25^\circ\text{C}$, $f = 1.0\text{MHz}$)

Symbol	Parameter ⁽¹⁾	Conditions	Max.	Unit
CIN	Input Capacitance	$V_{IN} = 0\text{V}$	11	pF
COUT	Output Capacitance	$V_{IN} = 0\text{V}$	11	pF

2689 tbl 13

NOTE:

1. This parameter is determined by device characterization but is not production tested.

TIMING WAVEFORM OF WRITE CYCLE NO. 1, (R/W CONTROLLED TIMING) (1,2,3,7)

TIMING WAVEFORM OF WRITE CYCLE NO. 2, ($\overline{CE}$ CONTROLLED TIMING) (1,2,3,5)

NOTES:

1. R/W must be high during all address transitions.
2. A write occurs during the overlap (tew or twp) of a low $\overline{CE}$ and a low R/W.
3. twr is measured from the earlier of $\overline{CE}$ or R/W going high to the end of the write cycle.
4. During this period, the I/O pins are in the output state and input signals must not be applied.
5. If the $\overline{CE}$ low transition occurs simultaneously with or after the R/W low transition, the outputs remain in the high impedance state.
6. Transition is measured $\pm 500\text{mV}$ from steady state with a 5pF load (including scope and jig).
7. If $\overline{CE}$ is low during a R/W controlled write cycle, the write pulse width must be larger of twp or (twz + tow) to allow the I/O drivers to turn off and data to be placed on the bus for the required tow. If $\overline{CE}$ is high during an R/W controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified twp.

1. $\overline{OEL} = \overline{OER} = V_L$
2. $\overline{INT_R}$ and $\overline{INT_L}$ are reset (high) during power up.

16-BIT MASTER/SLAVE DUAL-PORT MEMORY SYSTEMS

2689 drw 22

NOTE:

1. No arbitration in IDT7140 (SLAVE). $\overline{BUSY-IN}$ inhibits write in IDT7140 (SLAVE).

FUNCTIONAL DESCRIPTION:

The IDT7130/IDT7140 provides two ports with separate control, address, and I/O pins that permit independent access for reads or writes to any locations in memory. The IDT7130/IDT7140 has an automatic power down feature controlled by $\overline{CE}$. The $\overline{CE}$ controls on-chip power down circuitry that permits the respective port to go into a standby mode when not selected ($\overline{CE}$ high). When a port is enabled, access to the entire memory array is permitted. Each port has its own Output Enable control ($\overline{OE}$). In the read mode, the port's $\overline{OE}$ turns on the output drivers when set LOW. Non-contention READ/WRITE conditions are illustrated in Table 1.

The interrupt flag ($\overline{INT}$) permits communication between ports or systems. If the user chooses to use the interrupt function, a memory location (mail box or message center) is assigned to each port. The left port interrupt flag ($\overline{INTL}$) is set when the right port writes to memory location 3FE (HEX). The left port clears the interrupt by reading address location 3FE. Likewise, the right port interrupt flag ($\overline{INTR}$) is set when the left port writes to memory location 3FF (HEX) and to clear the interrupt flag ($\overline{INTR}$), the right port must read the memory location 3FF. The message (8-bits) at 3FE or 3FF is user defined. If the interrupt function is not used, address locations 3FE or 3FF are not used as mailboxes, but as part of the random access memory. Refer to Table II for the interrupt operation.

ARBITRATION LOGIC**FUNCTIONAL DESCRIPTION:**

The arbitration logic will resolve an address match or a chip enable match down to 5ns minimum and determine which port has access. In all cases, an active $\overline{BUSY}$ flag will be set for the delayed port.

The $\overline{BUSY}$ flags are provided for the situation when both ports simultaneously access the same memory location. When this situation occurs, on-chip arbitration logic will determine which port has access and sets the delayed port's $\overline{BUSY}$ flag. $\overline{BUSY}$ is set at speeds that permit the processor to hold the operation and its respective address data. It is important to note that the write operation is invalid for the

port that has $\overline{BUSY}$ set LOW. The delayed port will have access when $\overline{BUSY}$ goes inactive.

Contention occurs when both left and right ports are active and both addresses match. When this situation occurs, the on-chip arbitration logic determines access. Two modes of arbitration are provided: (1) if the addresses match and are valid before $\overline{CE}$, on-chip control logic arbitrates between $\overline{CEL}$ and $\overline{CER}$ for access; or (2) if the $\overline{CE}$ s are low before an address match, on-chip control logic arbitrates between the left and right addresses for access (refer to Table II). In either mode of arbitration, the delayed port's $\overline{BUSY}$ flag is set and will reset when the port granted access completes its operation.

DATA BUS WIDTH EXPANSION**MASTER/SLAVE DESCRIPTION:**

Expanding the data bus width to sixteen-or-more-bits in a dual-port RAM system implies that several chips will be active at the same time. If each chip includes a hardware arbitrator, and the addresses for each chip arrive at the same time, it is possible that one will activate its $\overline{BUSYL}$ while another activates its $\overline{BUSYR}$ signal. Both sides are now busy and the CPUs will wait indefinitely for their port to become free.

To avoid the "Busy Lock-Out" problem, IDT has developed a MASTER/SLAVE approach where only one arbitrator, in the MASTER, is used. The SLAVE has $\overline{BUSY}$ inputs which allow an interface to the MASTER with no external components and with a speed advantage over other systems.

When expanding dual-port RAMs in width, the writing of the SLAVE RAMs must be delayed, until after the $\overline{BUSY}$ input has settled. Otherwise, the SLAVE chip may begin a write cycle during a contention situation. Conversely, the write pulse must extend a hold time past $\overline{BUSY}$ to ensure that a write cycle takes place after the contention is resolved. This timing is inherent in all dual-port memory systems where more than one chip is active at the same time.

The write pulse to the SLAVE should be delayed by the maximum arbitration time of the MASTER. If, then, a contention occurs, the write to the SLAVE will be inhibited due to $\overline{BUSY}$ from the MASTER.
