FUNCTIONAL DESCRIPTION

DIVIDE FACTOR OF PROGRAMMABLE DIVIDER

Serial data of binary code is input to Data pin. These data are loaded into the 18-bit shift register from MSB. When load enable signal LE is high, the data stored in the 18-bit shift register is transferred to the 18-bit latch. The data ① to ⑦ set a divide factor of the binary 7-bit swallow counter and data ⑧ to ⑱ set a divide factor of binary 11-bit programmable counter. In other words, serial data is equivalent to the divide factor of programmable divider.

A : Preset divide factor of binary 7-bit swallow counter (0 to 127)

f_r : Output frequency of the programmable reference divider

- Clock:** Clock signal input for the 18-bit shift register.
Each rising edge of the clock shifts one bit of data into the shift register.
- Data:** Serial data for the 18-bit shift register is input.
- LE:** Load enable input.
When LE is high (high active), the data stored in the 18-bit shift register is transferred to the 18-bit latch.
The 18-bit data is used for setting a divide factor of the programmable divider.
