## CMOS LCD SEGMENT DRIVER

### ■ DESCRIPTION

The SED1606 is an 80-output segment (column) driver for use in combination with an SED1635. It is provided with high-vision measure of the LCD display and adopts high speed inable chain system for low power operation and slim chip shape suitable for minimizing of the LCD panel. Also, low voltage operation of the logic power source suits a wide range of applications.

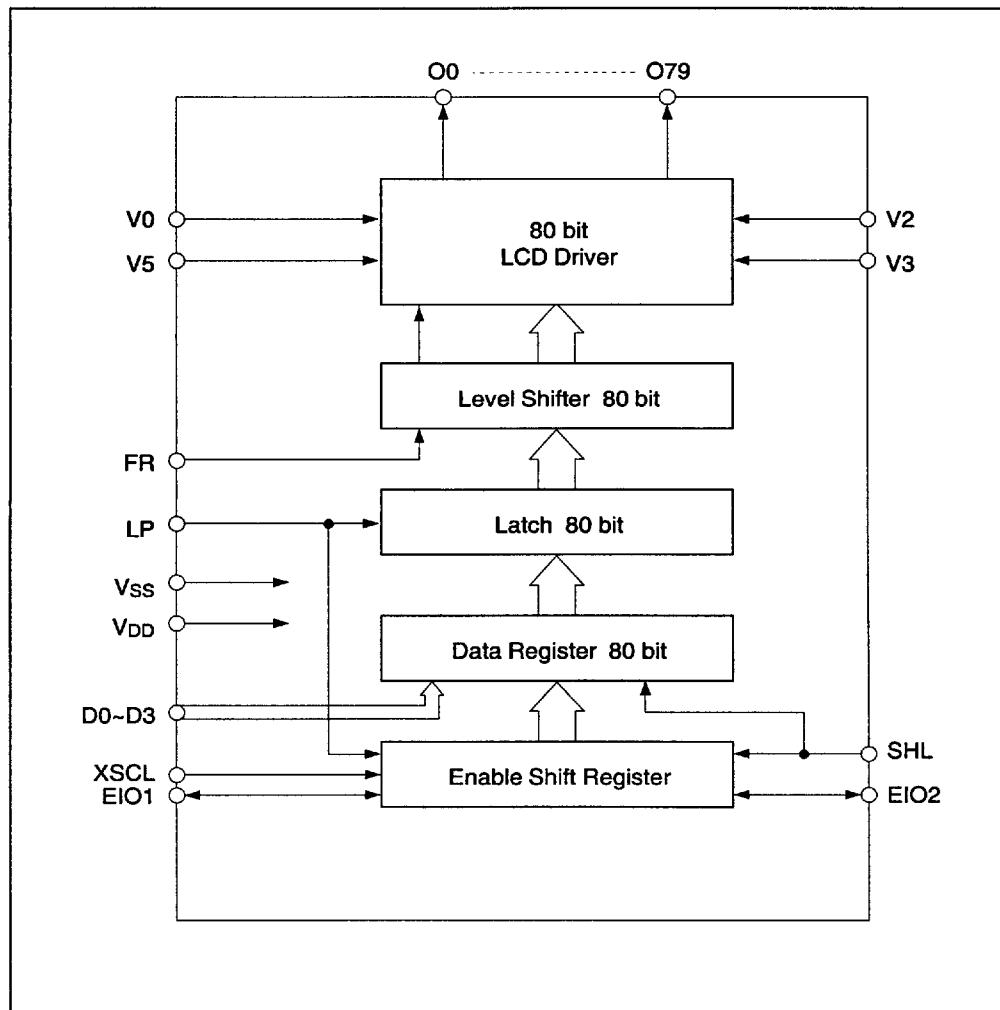

### ■ FEATURES

- LCD driver output number ..... 80
- Ultra-slim chip
- Low current consumption
- Low voltage operation ..... -2.7V max.
- Wide range of liquid crystal drive voltage ..... -8 to -28V
- High speed and low power data transfer is possible by adoption of the 4-bit bus inable chain system.  
Shift clock frequency:
  - 6.5MHz (at -2.7V)
  - 10.0MHz (at -4.5V)
- Non-bias display off function
- Pin selection of the output shift direction is available
- Offset bias regulation of the liquid crystal power is possible depending on the V<sub>DD</sub> level
- Logic system power source ..... -2.7 to -5.5V
- Product shapes

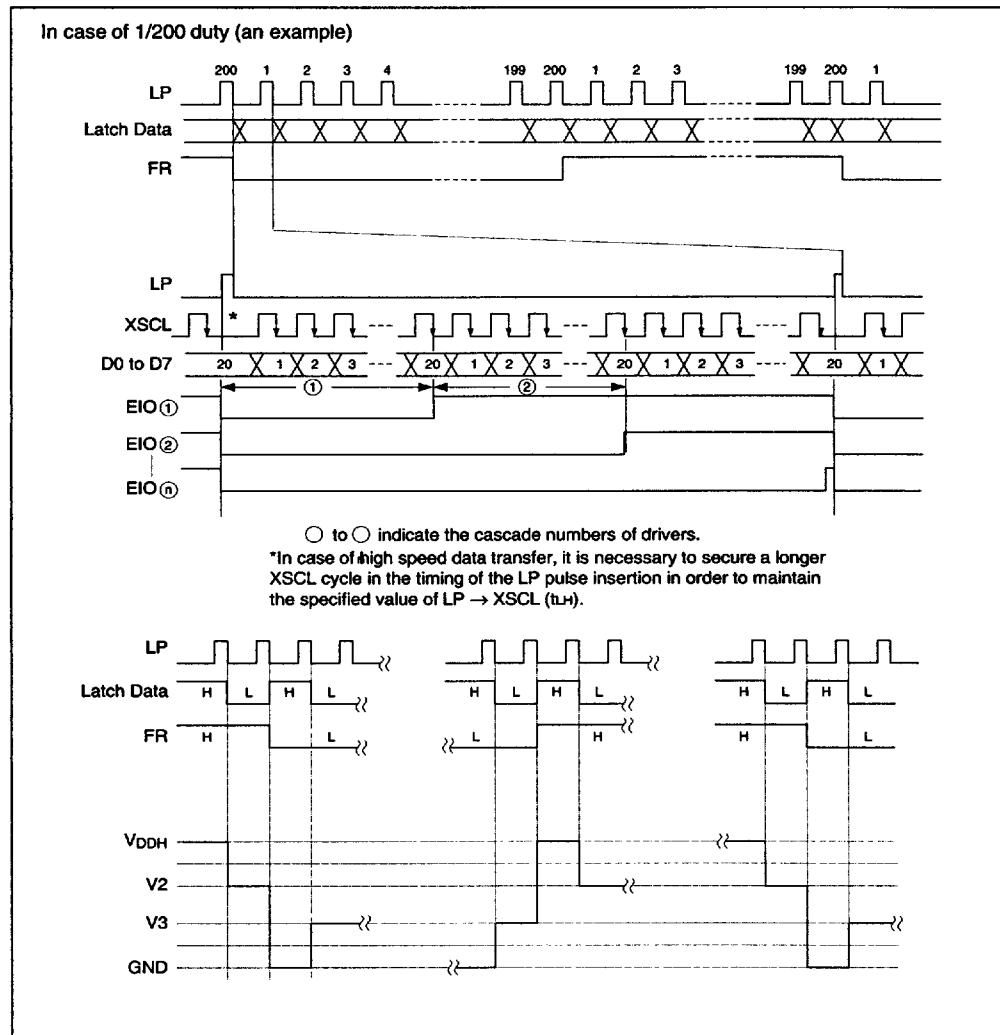

## SED1606D<sub>0A</sub>/D<sub>0B</sub>

### ■ BLOCK DIAGRAM

## ■ TIMING DIAGRAM

**■ FUNCTIONS****● Inable Shift Register**

The inable shift register is a bi-directional shift register wherewith the shift direction is determined by the SHL inputs and outputs of such shift register are used to store data bus signals to the data register. When inable signals are in the disable state, the internal clock signal and data bus are fixed to "L" to become the power save mode.

When using multiple units of the segment driver, EIO terminals of each driver should be connected by the cascade connection and the EIO terminals of the top end driver should be connected to "V<sub>DD</sub>". (Refer to the connection example). Since the inable control circuit automatically detects when all the 80-bit data are taken in and automatically transfers the inable signal, control signals from a controlling LSI are not needed.

**● Data Register**

This is a register for serial and parallel conversion of data bus signals by means of the inable shift register output. Consequently, the relations between the serial display data and segment outputs are determined independently from the shift clock input number.

**● Latch**

It takes in the contents of the data register by means of the trailing edge trigger of the LP to transmit the output to the level shifter.

**● Level Shifter**

This is a level interface circuit to convert the voltage level of signals from logic level to LCD driving level.

**● LCD Driver**

It outputs the LCD drive voltage.

Relations among data bus signals, alternating signals FR and the segment output voltage are given below.

Data Bus Signals	FR	O Output Voltage
H	H	V <sub>0</sub>
	L	V <sub>5</sub>
L	H	V <sub>2</sub>
	L	V <sub>3</sub>

## ■ FUNCTIONS OF THE TERMINALS

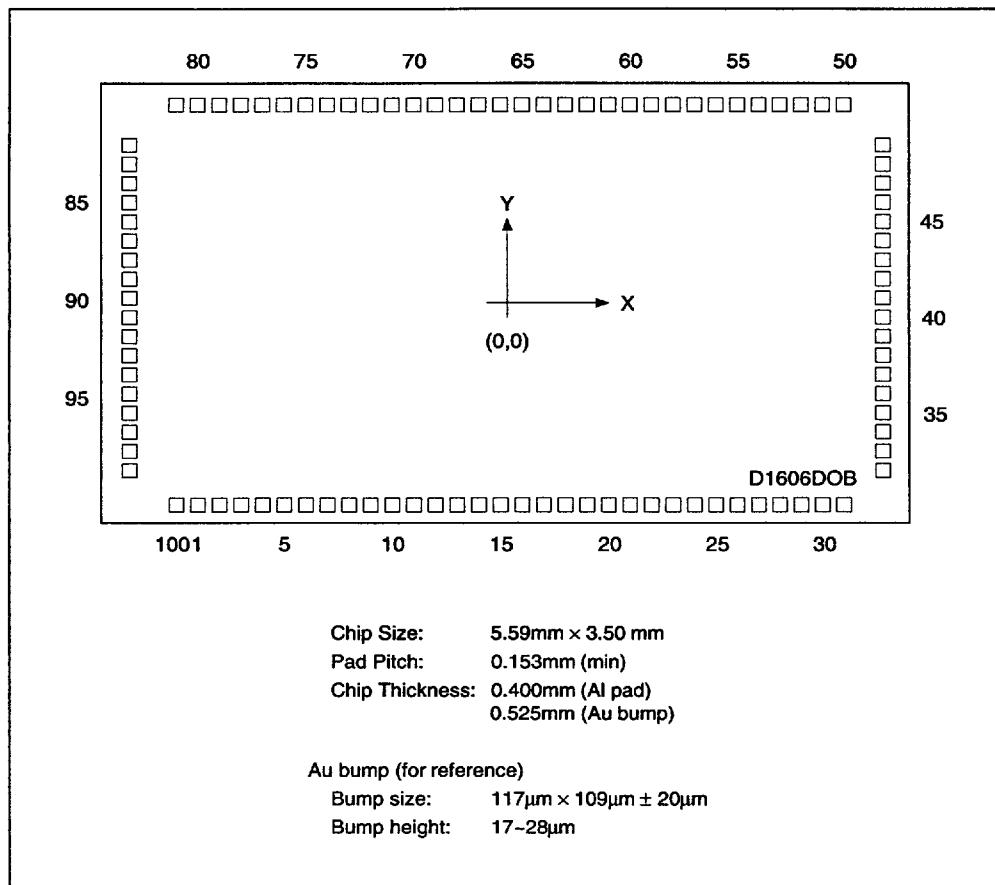

Terminal Name	I/O	Description	Numbers of Pins																																								
O 0 ~ O <sub>79</sub>	O	LCD driving segment (column) output The output level varies at the trailing edge of the LP.	80																																								
D <sub>0</sub> ~ D <sub>3</sub>	I	Display data input	4																																								
XSCL	I	Shift clock input of display data (trailing edge trigger)	1																																								
LP	I	Latch pulse input of display data (trailing edge trigger)	1																																								
EIO1 EIO2	I/O	Enable input and output Set to input or output depending on the SHL input level. The output is reset by the LP input and, after receiving 80 bit data, it automatically rises to "H"	2																																								
SHL	I	Shifting direction choice, and input/output controlling input to the EIO terminal When data is input to (D <sub>3</sub> , D <sub>2</sub> , ..., D <sub>0</sub> ) terminals in the order of (a <sub>3</sub> , a <sub>2</sub> , a <sub>1</sub> , a <sub>0</sub> ) (b <sub>3</sub> , b <sub>2</sub> , b <sub>1</sub> , b <sub>0</sub> ), ..., (t <sub>2</sub> , t <sub>2</sub> , t <sub>1</sub> , t <sub>0</sub> ), relations between data and segment outputs are as follows.	1																																								
		<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <th rowspan="2">S</th> <th colspan="7">O Output</th> <th colspan="2">EIO</th> </tr> <tr> <td>H</td> <td>79</td> <td>78</td> <td>77</td> <td>.....</td> <td>2</td> <td>1</td> <td>0</td> <td>EIO1</td> <td>EIO2</td> </tr> <tr> <td>L</td> <td>a<sub>3</sub></td> <td>a<sub>2</sub></td> <td>a<sub>1</sub></td> <td>....</td> <td>t<sub>2</sub></td> <td>t<sub>1</sub></td> <td>t<sub>0</sub></td> <td>Output</td> <td>Input</td> </tr> <tr> <td>H</td> <td>t<sub>0</sub></td> <td>t<sub>1</sub></td> <td>t<sub>2</sub></td> <td>....</td> <td>a<sub>1</sub></td> <td>a<sub>2</sub></td> <td>a<sub>3</sub></td> <td>Input</td> <td>Output</td> </tr> </table> <p>Note: Relations between the data and segment outputs are determined independent from the shift clock number.</p>	S	O Output							EIO		H	79	78	77	.....	2	1	0	EIO1	EIO2	L	a <sub>3</sub>	a <sub>2</sub>	a <sub>1</sub>	....	t <sub>2</sub>	t <sub>1</sub>	t <sub>0</sub>	Output	Input	H	t <sub>0</sub>	t <sub>1</sub>	t <sub>2</sub>	....	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>	Input	Output	
S	O Output							EIO																																			
	H	79	78	77	.....	2	1	0	EIO1	EIO2																																	
L	a <sub>3</sub>	a <sub>2</sub>	a <sub>1</sub>	....	t <sub>2</sub>	t <sub>1</sub>	t <sub>0</sub>	Output	Input																																		
H	t <sub>0</sub>	t <sub>1</sub>	t <sub>2</sub>	....	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>	Input	Output																																		
FR	I	Input of the alternating signal of the LCD drive output	1																																								
V <sub>DD</sub> , V <sub>SS</sub>	Power source	Power supply for the logics V <sub>DD</sub> : 0V V <sub>SS</sub> : -2.7 ~ -5.5V	2																																								
V <sub>0</sub> , V <sub>2</sub> , V <sub>3</sub> , V <sub>5</sub>	Power source	Power supply for the LCD driver circuit V <sub>DD</sub> : 0V V <sub>5</sub> : -8 ~ -28V V <sub>DD</sub> ≥ V <sub>0</sub> ≥ V <sub>2</sub> 6/9 V <sub>5</sub> *1 3/9 V <sub>5</sub> ≤ V <sub>3</sub> ≤ V <sub>5</sub>	4																																								

Total 100  
(including NC4)

\*1. Be sure to connect pairs of V<sub>0</sub> – V<sub>5</sub> to respective LCD power sources.

## SED1606D<sub>0A</sub>/D<sub>0B</sub>

### ■ ELECTRICAL CHARACTERISTICS ● Absolute Maximum Rating

Parameters	Codes	Ratings	Units
Power voltage (1)	V <sub>SS</sub>	-7.0 ~ +0.3	V
Power voltage (1)	V <sub>S</sub>	-30.0 ~ +0.3	V
Power voltage (3)	V <sub>0</sub> , V <sub>2</sub> , V <sub>3</sub>	V <sub>S</sub> - 0.3 ~ V <sub>DD</sub> +0.3	V
Input voltage	V <sub>I</sub>	V <sub>SS</sub> - 0.3 ~ V <sub>DD</sub> +0.3	V
Output voltage	V <sub>O</sub>	V <sub>SS</sub> - 0.3 ~ V <sub>DD</sub> +0.3	V
EIO output current	I <sub>O1</sub>	20	mA
Working temperature	T <sub>OPR</sub>	-40 ~ +85	°C
Storage temperature 1	T <sub>STG1</sub>	-65 ~ +150	°C

Note 1. All the above voltages are based on V<sub>DD</sub> = 0V.

Note 2. The storing temperature 1 specifies that of chips proper.

Note 3. Voltage of V<sub>0</sub>, V<sub>2</sub> and V<sub>3</sub> should always be maintained under a condition of V<sub>DD</sub> ≥ V<sub>0</sub> ≥ V<sub>2</sub> ≥ V<sub>3</sub> ≥ V<sub>5</sub>.

Note 4. When logic power becomes floating state or if V<sub>SS</sub> = -2.6 or beyond while the LCD driver power source is being applied, the LSI may be permanently damaged and avoid such circumstances.

Pay extra attention to the power sequence at times of turning on and turning off the power supply.

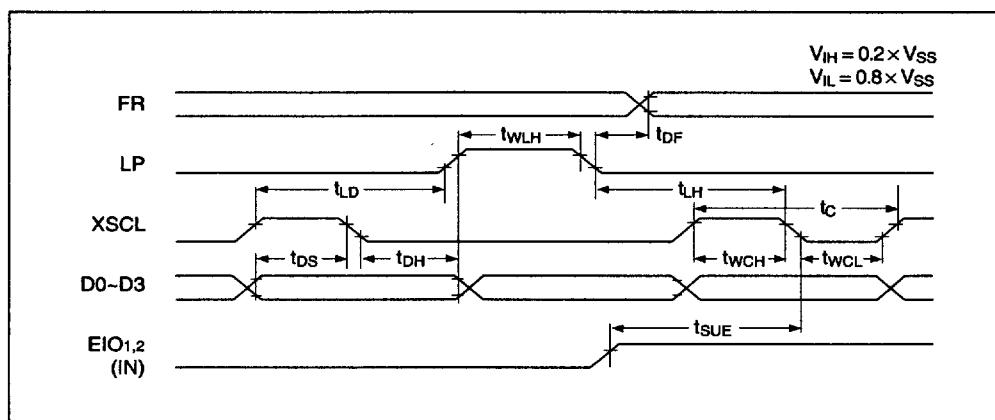

## ● DC Characteristics

Unless otherwise designated, V<sub>DD</sub> = V<sub>O</sub> = 0V, V<sub>SS</sub> = -5.0 ± 10% and T<sub>A</sub> = -40 to 85°C
