MOSEL

MS6264C

8K x 8 Low Power CMOS SRAM

T-46-23-12

2

FEATURES

- Available in 80/100/150 ns (Max.)
- Automatic power-down when chip disabled
- Lower power consumption:

  MS6264C
  - 1mA (Max.) Data Retention Current
  - 11mW (Max.) Standby

  MS6264CL
  - 25µA (Max.) Data Retention Current
  - 0.55mW (Max.) Standby

  MS6264CLL
  - 2µA (Max.) Data Retention Current
  - 0.55mW (Max.) Standby
- TTL compatible interface levels
- Single 5V power supply
- Fully static operation, no clock required
- Three state outputs
- Two chip enable ($\overline{E}_1$ and E_2) for simple memory expansion
- Data retention as low as 2V

DESCRIPTION

The MOSEL MS6264C is a high performance, low power CMOS static RAM organized as 8192 words by 8 bits. The device supports easy memory expansion with both an active LOW chip enable ($\overline{E}_1$) and an active High chip enable (E_2), as well as an active LOW output enable ($\overline{G}$) and tri-state outputs. An automatic power-down feature is included which reduces the chip power by 80% in TTL standby mode, and by over 95% in full power-down mode.

The device is manufactured in MOSEL's high performance CMOS process and operates from a single 5V power supply. All inputs and outputs are TTL compatible. Data is retained to as low as V_{CC} = 2V.

The MOSEL MS6264C is packaged in the JEDEC standard 28 pin 600 mil wide DIP, 330 mil wide SOP and 28 pin 300 mil thin DIP.

PIN DESCRIPTIONS

A_0 - A_{12} Address Inputs
These 13 address inputs select one of the 8192 8-bit words in the RAM.

$\overline{E}_1$ Chip Enable 1 Input

E_2 Chip Enable 2 Input
$\overline{E}_1$ is active LOW and E_2 is active HIGH. Both chip enables must be active to read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high-impedance state when the device is deselected.

$\overline{G}$ Output Enable Input
The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when $\overline{G}$ is inactive.

$\overline{W}$ Write Enable Input
The write enable input is active LOW and controls read and write operations. With the chip selected, when $\overline{W}$ is HIGH and $\overline{G}$ is LOW, output data will be present at the DQ pins; when $\overline{W}$ is LOW, the data present on the DQ pins will be written into the selected memory location.

DQ_1 - DQ_8 Data Input/Output Ports
These 8 bidirectional ports are used to read data from or write data into the RAM.

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

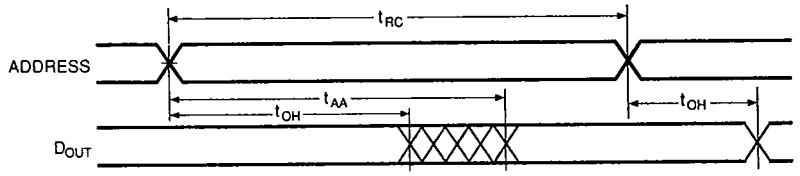
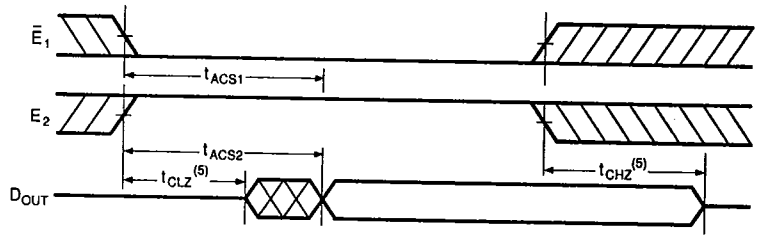
SWITCHING WAVEFORMS (READ CYCLE)

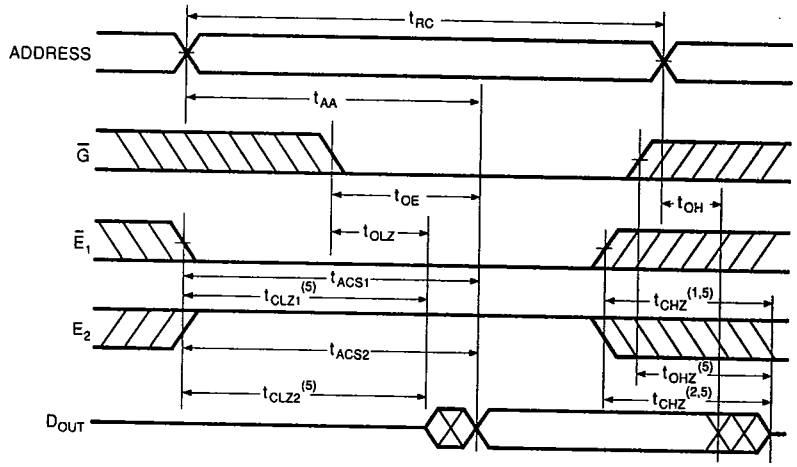
READ CYCLE 1 (1,2,4)



READ CYCLE 2[1,3,4]



READ CYCLE 3[1,4]



NOTES:
1. $\overline{W}$ is high for READ Cycle.
2. Device is continuously selected $\overline{E}_1 = V_{IL}$ and $E_2 = V_{IH}$.
3. Address valid prior to or coincident with $\overline{E}_1$ transition low and/or E_2 transition high.
4. $\overline{G} = V_{IL}$.
5. Transition is measured ± 500mV from steady state with C_L = 5pF as shown in Figure 1b. This parameter is guaranteed but not 100% tested.

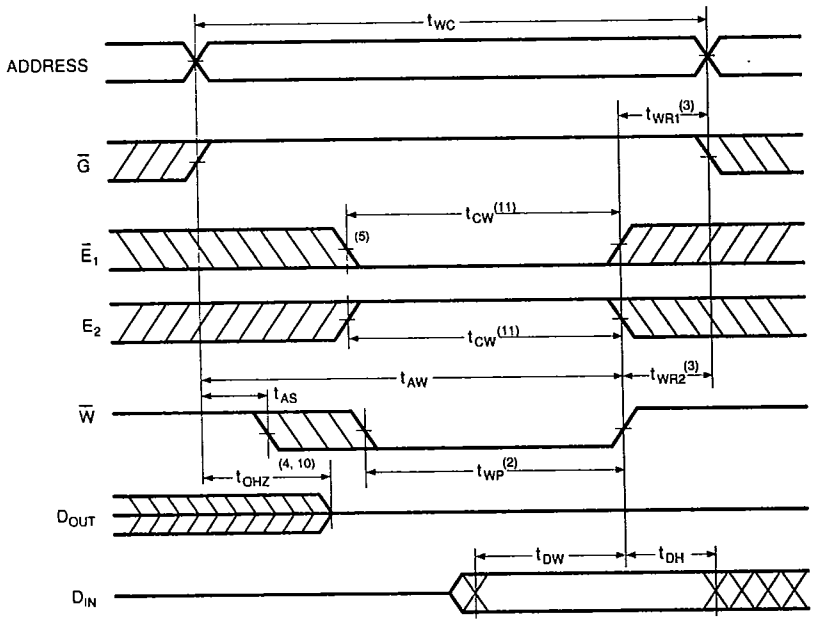
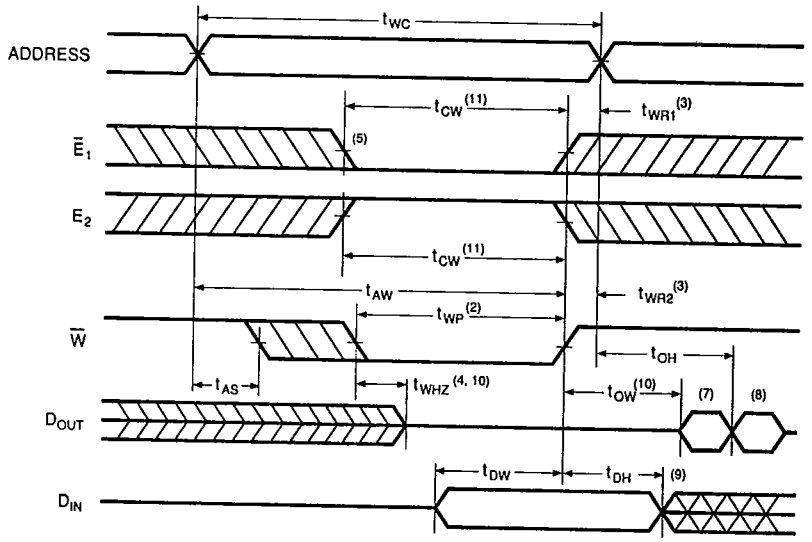
SWITCHING WAVEFORMS (WRITE CYCLE)

WRITE CYCLE 1[1]



WRITE CYCLE 2[1,6]



NOTES:

1. $\bar{W}$ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\bar{E}_1$ and E_2 active and $\bar{W}$ low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. T_{wr} is measured from the earlier of $\bar{E}_1$ or $\bar{W}$ going high or E_2 going low at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\bar{E}_1$ low transition or the E_2 high transition occurs simultaneously with the $\bar{W}$ low transitions or after the $\bar{W}$ transition, outputs remain in a high impedance state.
6. $\bar{G}$ is continuously low ($\bar{G} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\bar{E}_1$ is low and E_2 is high during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured ±500mV from steady state with C_L = 5pF as shown in Figure 1b on page 4. This parameter is guaranteed but not 100% tested.
11. t_{cw} is measured from the later of $\bar{E}_1$ going low or E_2 going high to the end of write.
