

# AP2101

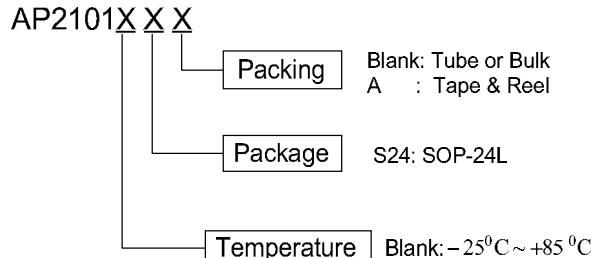

Power-Housekeeping PWM Combo Controller

(Preliminary)

## ■ Features

- A complete PWM control and housekeeping circuitry
- Precision voltage reference trimmed to 2%
- Dual output for push-pull operation
- Each output Transistor for 200mA sink current
- Variable duty cycle by dead time control (DTC)
- Soft start capability
- Double pulse suppression logic
- Over voltage protection (OVP) for  $3.3V \pm 5V \pm 12V$
- Under voltage protection (UVP) for  $3.3V \pm 5V \pm 12V$
- One more external input for various protections (PT)
- Remote on/off control function (PS-ON)
- Latch function controlled by remote and protection input
- Power good signal generator (PG) with hysteresis

## ■ Ordering Information

## ■ General Description

The AP2101 is a monolithic pulse-width modulation (PWM) control circuit with complete housekeeping circuitry for use in the secondary side of SMPS (Switching mode power supply). It contains various functions, which are precision voltage reference, over voltage protection (OVP), under voltage protection (UVP), remote on/off control, power good signal generator (PG) and etc. The AP2101 only requires few external components to accomplish a complete housekeeping circuit for SMPS, and is available in a 24-pin dual in-line package.

### OVP

It has OVP functions for  $+3.3V$ ,  $+5V$ ,  $+12V$ ,  $-5V$ ,  $-12V$  and PT outputs. The circuit is made of a comparator with six detecting inputs and without hysteresis voltage. Especially, PT (Pin18) is prepared for and extra OVP input or another protection signal.

### UVP

It also has UVP functions for  $+3.3V$ ,  $+5V$ ,  $+12V$ ,  $-5V$ ,  $-12V$  output. The block is made up of a comparator with five detecting inputs and without hysteresis voltage.

### Remote on/off

Remote on/off section is used to control SMPS externally. If a high signal is supplied to the remote on/off input, PWM signal becomes a high state and all secondary outputs are grounded. The remote on/off signal is transferred with some on-delay and off-delay time of 8ms, 24ms respectively.

### Precision voltage reference

The reference voltage trimmed to  $\pm 2\%$  ( $4.9V \leq V_{ref} \leq 5.1V$ )

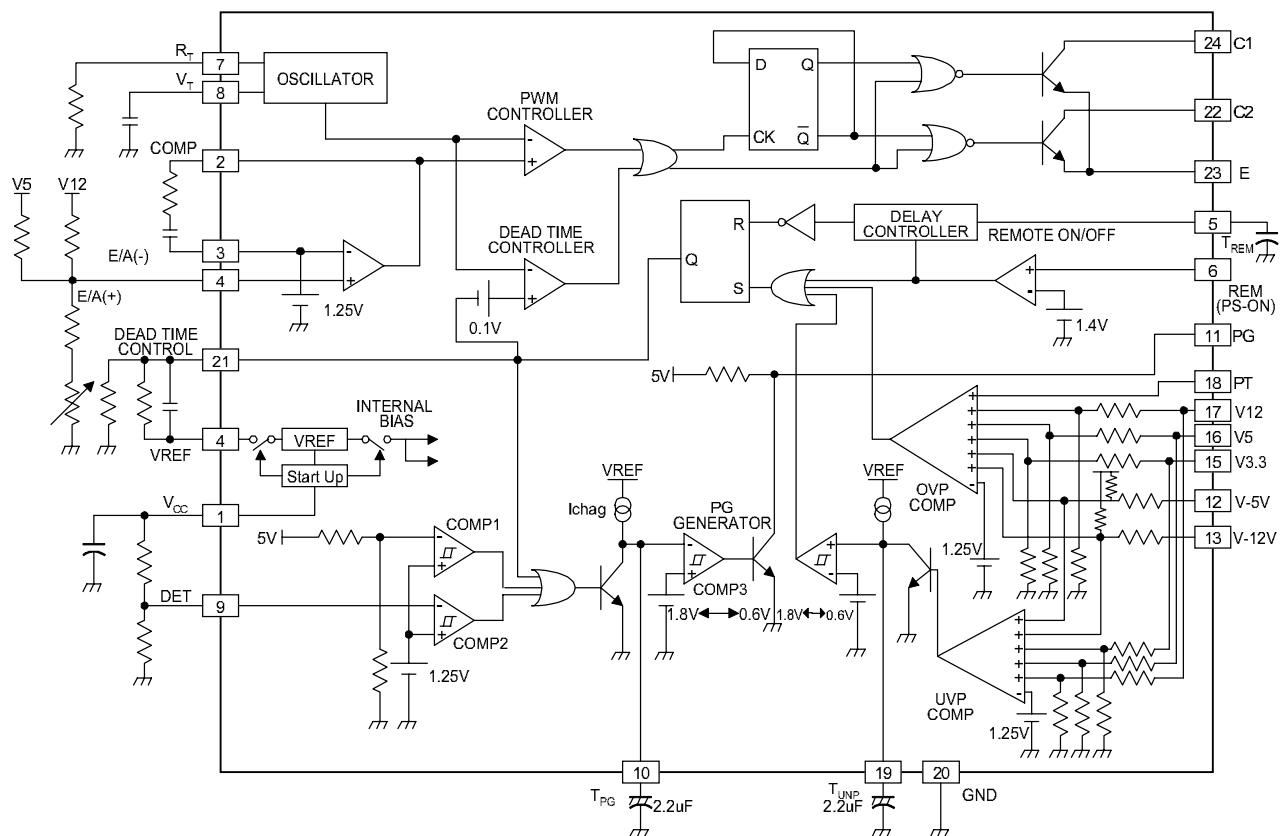

### PG

PG is to monitor the voltage level of power supply for safe operation of a microprocessor.

## ■ Function Descriptions

Name	Function
VCC	Supply voltage. Operating range is 14V~30V. VCC=20V, Ta=25°C at test
COMP	Error amplifier output. It is connected to non-inverting input of pulse width modulator comparator.
E/A(-)	Error amplifier inverting input. Its reference voltage is always 1.25V.
E/A(+)	Error amplifier non-inverting input feedback voltage. This pin may be used to sense power supply output voltage.
TREM	Remote on/off delay. Ton/Toff = 8ms/24ms (Typ.) with C=0.1μF. Its high/low threshold voltage is 1.7V/0.6V.
REM	Remote on/off input. It is TTL operation and its threshold voltage is 1.4V Voltage at this pin can reach normal 4.6V, with absolutely maximum voltage, 5.25V. If REM="Low", PWM="Low". That means the main SMPS is operational. When REM="High", then PWM="High" and the main SMPS is turned-off.
RT	Oscillation frequency setting R. (Test Condition R <sub>T</sub> =10kΩ)
CT	Oscillation frequency setting C. (Test Condition C <sub>T</sub> =0.01μF)
DET	Under-voltage detect pin. Its threshold voltage is 1.25V Typ.
T <sub>PG</sub>	PG delay. Td=250ms (Typ) with C <sub>PG</sub> =2.2μF. The high/low threshold voltage are 1.8V/0.6V and the voltage of Pin10 is clamped at 2.9V for noise margin.
PG	Power good output signal. PG="High" means that the power is "Good" for operation and PG="Low" means "Power fail".
V-5	Over voltage protection for output -5V (Typical Value = -6.2V)
V-12	Over voltage protection for output -12V (Typical Value = -14.2V)
Vref	Precision voltage reference trimmed to 2%. (Typical Value = 5.03V)
V3.3	Over voltage protection for output 3.3V. (Typical Value = 4.1V)
V5	Over voltage protection for output 5V. (Typical Value = 6.2V)
V12	Over voltage protection for output 12V. (Typical Value = 14.2V)
PT	This is prepared for an extra OVP input or another protection signal. (Typical Value = 1.25V)
T <sub>UVP</sub>	Timing pin for under voltage protection blank-out time. Its threshold voltage is 1.8V and clamped at 2.9V after full charging. Target of delay time is 250ms and it is realized through external (C=2.2μF).
GND	Signal ground.
DTC	Dead time control input. The dead-time control comparator has an effective 120mV input offset which limits the minimum output dead time. Setting the dead time control input a fixed voltage, ranging between 0V to 3.3V may impose dead time on the output.
C2	Output driver 2 pin for push-pull operation.
E	Power ground.
C1	Output driver 1 pin for push-pull operation.
