

**TELEPHONE INTERFACE CIRCUIT**
**AN AT&T PRODUCT**
**ADVANCE DATA**

- WITHSTANDS TELEPHONE LOOP VOLTAGES TO 150 V DC AND 200 V PULSED
- OPERATES AT LOW TIP-RING VOLTAGES (typically as low as 2.7 V)
- POLARITY GUARD HAS LOW INTERNAL VOLTAGE DROPS
- MONOLITHIC SOLID-STATE CONSTRUCTION GIVES COMPETITIVE EDGE IN PHYSICAL AREA CONSERVATION AND RELIABILITY

**MINIDIP**

**ORDER CODE : LH1028BB**
**DESCRIPTION**

Dielectric isolation and a monolithic high-voltage DMOS technology are used to fabricate the LH1028 Telephone Interface Circuit (TIC). This integrated circuit performs the following basic functions : high-voltage dial pulse switching, protection against reversal of Tip-Ring polarity from the Central Office, and overvoltage/overcurrent protection of telephone circuits.

**PIN DESCRIPTION**

Pin	Symbol	Description
2	Tip	Tip Input
8	Ring	Ring Input
3	T Prime (T')	Positive Output of Polarity Guard
7	DP	Control for Internal Dial Pulse Switch
6	DP Prime (DP')	Control for Internal Dial Pulse Switch
4	R Prime (RP')	Negative Output of Polarity Guard
1,5	NC	No Connection Allowed Reserved Pins

## APPLICATION

The LH1028 device can be connected in the following manner to perform telephone interface functions. An overvoltage metal-oxide-varistor or other similar type of device shunts the Tip-Ring input terminal of the LH1028 TIC and limits the voltage across these terminals to less than 200 V (the maximum voltage rating of the LH1028). The output terminals of the LH1028 TIC are TPRIME (T') and

RPRIME (R'). T' and R' are the positive and negative sides of the TIC polarity guard, respectively. R' is connected to the telephone circuitry through a switch which is internal to the LH1028 TIC. This internal switch opens when a dial pulse voltage is applied between terminal DP (Dial Pulse) and DP' (Dial Pulse Prime).
