

## 13-BIT TO 26-BIT REGISTERED IDT74SSTVN16859 BUFFER WITH SSTL I/O

### FEATURES:

- 1:2 registered output buffer
- 2.3V to 2.7V operation for PC1600, PC2100, and PC2700
- 2.5V to 2.7V operation for PC3200
- Single bit propagation delay, TSSOP : 2.2ns, VFQFPN : 1.8ns
- SSTL\_2 Class I style data inputs/outputs
- Differential CLK input
- $\overline{\text{RESET}}$  control compatible with LVC MOS levels
- Latch-up performance exceeds 100mA
- ESD >2000V per MIL-STD-883, Method 3015; >200V using machine model (C = 200pF, R = 0)
- Available in 56 pin VFQFPN and 64 pin TSSOP packages

### APPLICATIONS:

- Ideally suited for stacked DIMM DDR registered applications
- Along with CSPT857C/D, Zero Delay PLL Clock buffer, provides complete solution for DDR1 DIMMs

### DESCRIPTION:

The SSTVN16859 is a 13-bit to 26-bit registered buffer designed for 2.3V-2.7V  $V_{DD}$  for PC1600 - PC2700 and 2.5V-2.7V  $V_{DD}$  for PC3200, and supports low standby operation. All data inputs and outputs are SSTL\_2 level compatible with JEDEC standard for SSTL\_2.

$\overline{\text{RESET}}$  is an LVC MOS input since it must operate predictably during the power-up phase.  $\overline{\text{RESET}}$ , which can be operated independent of CLK and  $\overline{\text{CLK}}$ , must be held in the low state during power-up in order to ensure predictable outputs (low state) before a stable clock has been applied.

$\overline{\text{RESET}}$ , when in the low state, will disable all input receivers, reset all registers, and force all outputs to a low state, before a stable clock has been applied. With inputs held low and a stable clock applied, outputs will remain low during the Low-to-High transition of  $\overline{\text{RESET}}$ .

| T <sub>STG</sub>                    | Storage Temperature Range                                                        | -65 to +150                    | °C   |

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.
- The output current will flow if the following conditions are observed:
  - Output in HIGH state
  - V<sub>O</sub> = V<sub>DDQ</sub>

## FUNCTION TABLE (1)

| Input |        |        |   | Q Outputs                     |
|-------|--------|--------|---|-------------------------------|
| RESET | CLK    | CLK    | D |                               |
| H     | ↑      | ↓      | L | L                             |
| H     | ↑      | ↓      | H | H                             |
| H     | L or H | L or H | X | Q <sub>0</sub> <sup>(2)</sup> |
| L     | X      | X      | X | L                             |

### NOTES:

- H = HIGH Voltage Level  
L = LOW Voltage Level  
X = Don't Care  
↑ = LOW to HIGH  
↓ = HIGH to LOW
- Q<sub>0</sub> = Output level before the indicated steady-state conditions were established.

## PIN DESCRIPTION

| Pin Names                 | Description                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------|
| Q1 - Q13                  | Data Output                                                                                                       |
| GND                       | Ground                                                                                                            |
| V <sub>DDQ</sub>          | Output-stage drain power voltage                                                                                  |
| V <sub>DD</sub>           | Logic power voltage                                                                                               |
| $\overline{\text{RESET}}$ | Asynchronous reset input - resets registers and disables data and clock differential input receivers              |
| V <sub>REF</sub>          | Input reference voltage                                                                                           |
| CLK                       | Positive master clock input                                                                                       |
| $\overline{\text{CLK}}$   | Negative master clock input                                                                                       |
| D1 - D13                  | Data Input - clocked in on the crossing of the rising edge of CLK and the falling edge of $\overline{\text{CLK}}$ |
| Center PAD                | Ground (MLF package only)                                                                                         |

## DC ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE FOR PC1600 - PC2700

Following Conditions Apply Unless Otherwise Specified:

Operating Condition: T<sub>A</sub> = 0°C to +70°C, V<sub>DD</sub> = 2.5V ± 0.2V, V<sub>DDQ</sub> = 2.5V ± 0.2V

| Symbol           | Parameter                                              | Test Conditions                                                                                                                                                                                                                                                                      | Min.                  | Typ. | Max. | Unit                    |

| tINACT | Differential Inputs Inactive Time <sup>(2)</sup>         | —                                             | 22   | —      | 22   | ns   |
| tsu    | Setup Time, Fast Slew Rate <sup>(3,5)</sup>              | Data Before CLK $\uparrow$ , CLK $\downarrow$ | 0.65 | 0.65   | —    | ns   |
|        | Setup Time, Slow Slew Rate <sup>(4,5)</sup>              |                                               | 0.75 | 0.75   | —    | ns   |
| th     | Hold Time, Fast Slew Rate <sup>(3,5)</sup>               | Data Before CLK $\uparrow$ , CLK $\downarrow$ | 0.75 | 0.65   | —    | ns   |
|        | Hold Time, Slow Slew Rate <sup>(2,5)</sup>               |                                               | 0.9  | 0.8    | —    | ns   |

### NOTES:

1. Data inputs must be low a minimum time of tACT max., after  $\overline{\text{RESET}}$  is taken HIGH.
2. Data and clock inputs must be held at valid levels (not floating) a minimum time of tINACT max., after  $\overline{\text{RESET}}$  is taken LOW.
3. For data signal input slew rate is  $\geq 1\text{V/ns}$ .
4. For data signal input slew rate is  $\geq 0.5\text{V/ns}$  and  $< 1\text{V/ns}$ .
5. CLK,  $\overline{\text{CLK}}$  signal input slew rates are  $\geq 1\text{V/ns}$ .

## SWITCHING CHARACTERISTICS OVER RECOMMENDED FREE-AIR OPERATING RANGE (UNLESS OTHERWISE NOTED)

|        |                                                               | VFQFPN        | —               | 2.5  | —      | ((TBD)) |      |
| tPHL   | $\overline{\text{RESET}}$ to Q                                | TSSOP, VFQFPN | —               | 5    | —      | 5       | ns   |

## TEST CIRCUITS AND WAVEFORMS

FOR PC1600 - PC2700,  $V_{DD} = 2.5V \pm 0.2V$   
FOR PC3200,  $V_{DD} = 2.6V \pm 0.1V$

**Load Circuit**

**Voltage and Current Waveforms  
Inputs Active and Inactive Times**

**Voltage Waveforms - Propagation Delay Times**

**Voltage Waveforms - Pulse Duration**

**Voltage Waveforms - Propagation Delay Times**

**Voltage Waveforms - Setup and Hold Times**

### NOTES:

1.  $C_L$  includes probe and jig capacitance.
2.  $I_{DD}$  tested with clock and data inputs held at  $V_{DD}$  or GND, and  $I_O = 0 \text{ mA}$ .
3. All input pulses are supplied by generators having the following characteristics: PRR  $\leq 10 \text{ MHz}$ ,  $Z_o = 50\Omega$ , input slew rate =  $1 \text{ V/ns} \pm 20\%$  (unless otherwise specified).
4. The outputs are measured one at a time with one transition per measurement.
5.  $V_{TT} = V_{REF} = V_{DD}/2$
6.  $V_{IH} = V_{REF} + 310 \text{ mV}$  (AC voltage levels) for differential inputs.  $V_{IH} = V_{DD}$  for LVC MOS input.
7.  $V_{IL} = V_{REF} - 310 \text{ mV}$  (AC voltage levels) for differential inputs.  $V_{IL} = \text{GND}$  for LVC MOS input.
8.  $t_{PDM}$  is  $t_{PD}$  with one output switching.  $t_{PDMSS}$  is  $t_{PD}$  with all outputs switching.
