## Preliminary

## 1M X 16 Bit Low Voltage Super RAM™

### Features

- Operating voltage: 2.7V to 3.1V
- Access times: 70 ns (max.)
- Current:  
A64S0616 series: Operating: 35mA (max.)  
Power Down Standby: 10µA (max.)
- Fully SRAM compatible operation
- Full static operation, no clock or refreshing required

- All inputs and outputs are directly TTL-compatible
- Common I/O using three-state output
- Industrial operating temperature range: -25°C to +85°C for -I
- Available in 48-ball Mini BGA (6X8) package.

### General Description

The A64S0616 is a low operating current 16,777,216-bit Super RAM organized as 1,048,576 words by 16 bits and operates on low power supply voltage from 2.7V to 3.1V. It is built using AMIC's high performance CMOS DRAM process.

Using hidden refresh technique, the A64S0616 provides a 100% compatible asynchronous interface.

Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures. The chip enable input is provided for POWER-DOWN, device enable. Two byte enable inputs and an output enable input are included for easy interfacing. This A64S0616 is suited for low power application such as mobile phone and PDA or other battery-operated handheld device.

### \*Comments

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

## Initialization

The A64S0616 is initialized in the power-on sequence according to the following.

1. To stabilize internal circuits, after turning on the power, a 350 $\mu$ s or longer wait time must precede any signal toggling.
2. After the wait time, it can be normal operation.

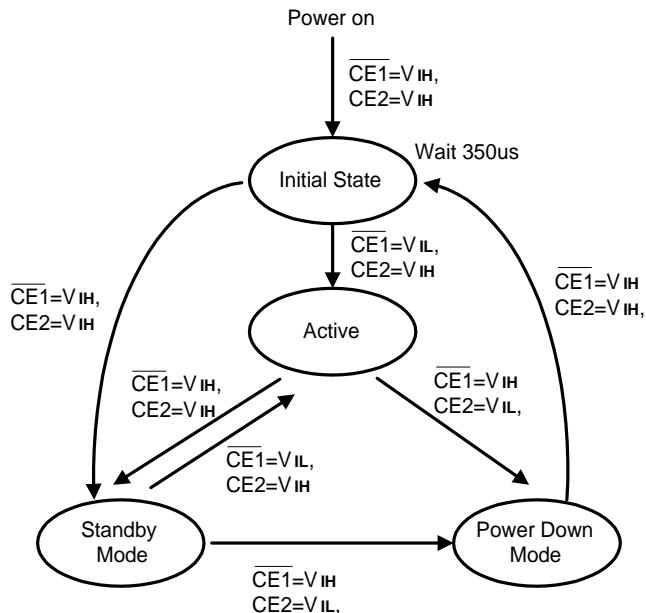

## Power on Chart

Notes:

1. Following power application, make **CE2** and  $\overline{\text{CE1}}$  high level during the wait time interval.
2. After power on sequence, the normal operating **CE2** must keep at high.

## Power on / Depower down State Machine

## Standby Mode Characteristics

Standby Mode	Memory Cell Data Hold	Standby Supply Current ( $\mu\text{A}$ )
Standby	Valid	100 ( $I_{SB1}$ )
Power down	Invalid	10 ( $I_{SB2}$ )

## Avoid Timing

Following figures are show you an abnormal timing which is not supported on Super RAM and their solution.

At normal operation, if your system have a timing which sustain invalid states over 10 $\mu$ s at normal mode like Figure 1. There are some guide line for proper operation of Super RAM.

When your system have multiple invalid address signal shorter than t<sub>RC</sub> on the timing which showed in Figure 1, Super RAM need toggle the  $\overline{CE1}$  to “high” about “t<sub>RC</sub>” (Figure 2).

### Timing Waveforms

#### Read Cycle 1<sup>(1, 2, 4, 6)</sup>

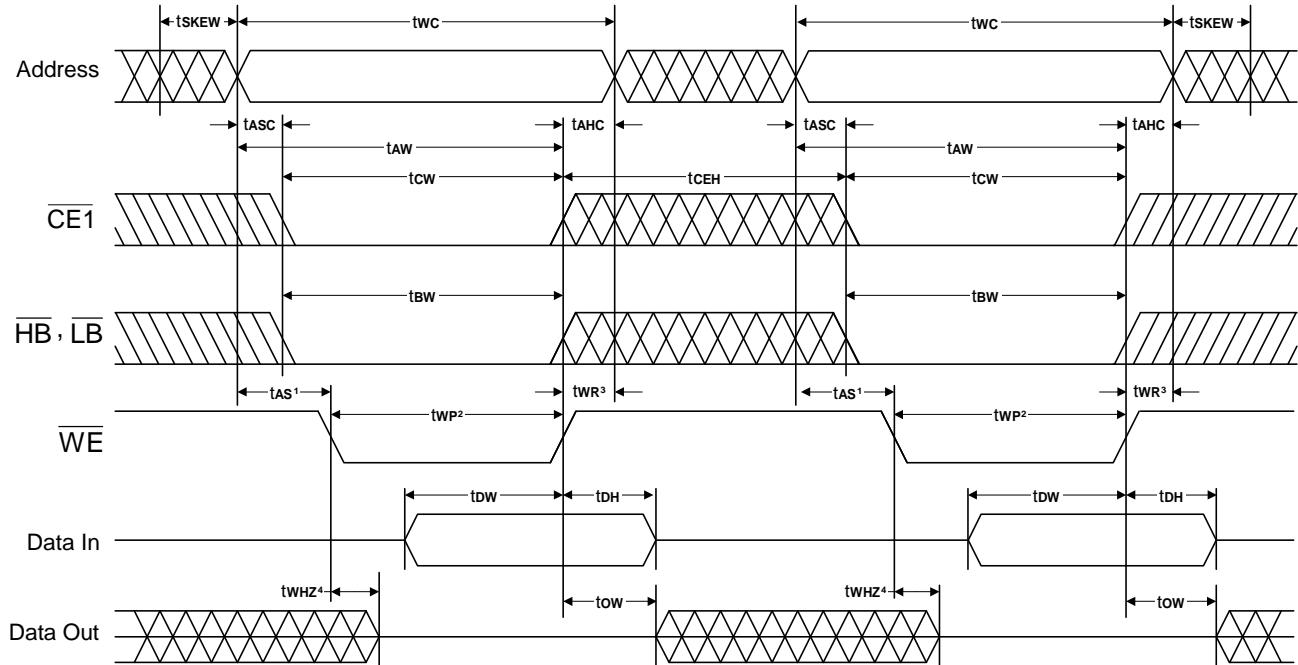

**Read Cycle 2-1<sup>(1, 3, 6)</sup>**

**Read Cycle 2-2<sup>(1, 3, 6)</sup>**

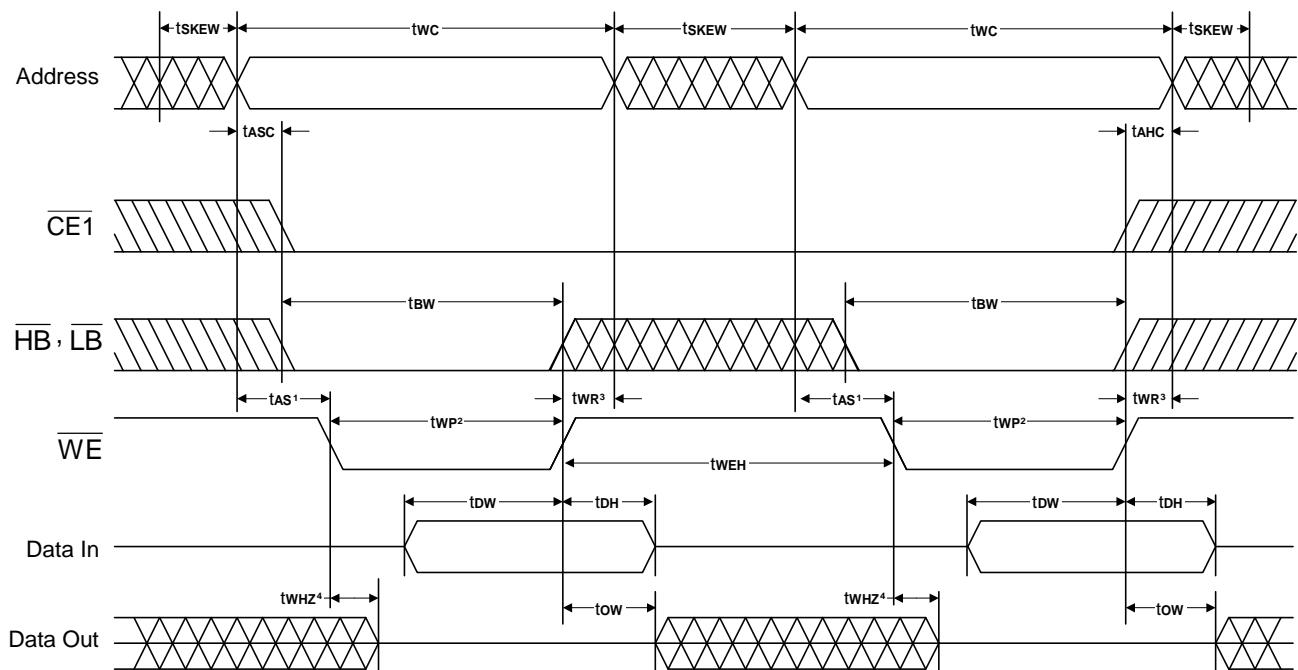

- Notes:
1.  $\overline{WE}$  is high for Read Cycle.
  2. Device is continuously enabled  $\overline{CE1} = V_{IL}$ ,  $\overline{HB} = V_{IL}$  and, or  $\overline{LB} = V_{IL}$ .
  3. Address valid prior to or coincident with  $\overline{CE1}$  and ( $\overline{HB}$  and, or  $\overline{LB}$ ) transition low.
  4.  $OE = V_{IL}$ .
  5. Transition is measured  $\pm 500\text{mV}$  from steady state. This parameter is sampled and not 100% tested.
  6.  $CE2$  is high for Read Cycle.

### Timing Waveforms (continued)

#### Write Cycle 3-1<sup>(6)</sup> (Byte Enable Controlled)

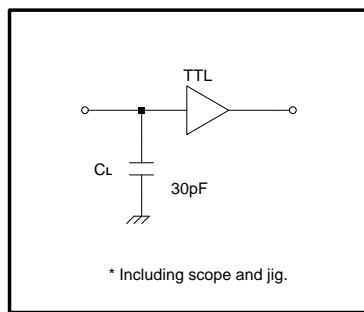

#### Write Cycle 3-2<sup>(6)</sup> (Byte Enable Controlled)

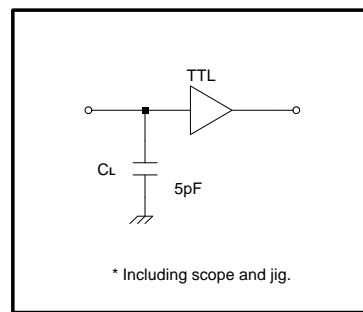

- Notes:
1.  $t_{AS}$  is measured from the address valid to the beginning of Write.
  2. A Write occurs during the overlap ( $t_{WP}$ ,  $t_{BW}$ ) of a low  $\overline{CE1}$ ,  $\overline{WE}$  and ( $\overline{HB}$  and, or  $\overline{LB}$ ).
  3.  $t_{WR}$  is measured from the earliest of  $\overline{CE1}$  or  $\overline{WE}$  or ( $\overline{HB}$  and, or  $\overline{LB}$ ) going high to the end of the Write cycle.
  4.  $\overline{OE}$  level is high or low.
  5. Transition is measured  $\pm 500\text{mV}$  from steady state. This parameter is sampled and not 100% tested.
  6. CE2 is high for Write Cycle.
