

Video switch for CANAL-Plus decoder

BA7632AF

The BA7632AF is an audio-switching ICs for decoders for scrambled pay channels used in France and other countries. The ICs include a five-input multiplexer, a four-input multiplexer and a two-input multiplexer, and allow decoder audio switching to be done with a single IC. When used in combination with the BA7630S common logic control can be used for audio and video switching.

○The BA7632AF has larger termination resistors on the inputs than the BA7631 and BA7631F.

●Applications

Video cassette recorders

●Features

- 1) All the audio-switching functions required for SECAM CANNAL-plus decoder integrated onto one chip.
- 2) Inputs terminated with 140k Ω resistors.
- 3) Built-in output buffer.
- 4) Wide supply voltage range (4.5V to 13.0V).
- 5) Low total harmonic distortion (Max. 0.005% Typ.).
- 6) Wide dynamic range (3.6V_{rms}, V_{CC} = 12V).
- 7) Same control logic as for the BA7630S can be used.

○ Not designed for radiation resistance.

● Circuit operation

The BA7632AF makes it easy to construct a decoder for the scrambled pay channels. They have been designed specifically for audio signal decoding. As shown in the application examples in Figs. 1 and 2, there are inputs for TV, VCR, decoder, and AUX, to

cover a wide range of applications. When the AUX input is not used, by setting CTL5 to "L", the system construction becomes the same as that of the BA7630S, and the BA7630S switching logic can be used as is.
