

## Timing Generator for Progressive Scan CCD Image Sensor

### Description

The CXD2457R is an IC developed to generate the timing pulses required by Progressive Scan CCD image sensors as well as signal processing circuits.

### Features

- Electronic shutter function
- Supports non-interlaced operation
- Base oscillation frequency 30.0MHz
- Horizontal drive frequency switchable between 15/10/5MHz
- Switchable between FINE (Progressive Scan) mode or DRAFT (high-frame rate readout) mode
- Vertical driver

### Applications

Progressive Scan CCD cameras

### Structure

Silicon gate CMOS IC

### Applicable CCD Image Sensor

ICX204AK

48 pin LQFP (Plastic)

### Absolute Maximum Ratings

|                         |                                      |                                  |    |
|-------------------------|--------------------------------------|----------------------------------|----|
| • Supply voltage        | $V_{DDA}, V_{DDb}, V_{DDC}, V_{DDD}$ | $V_{SS} - 0.5$ to $V_{SS} + 7.0$ | V  |
| • Supply voltage        | $V_{SS}$                             | $V_L - 0.5$ to $V_L + 10.0$      | V  |
| • Supply voltage        | $V_H$                                | $V_L - 0.5$ to $V_L + 26.0$      | V  |
| • Supply voltage        | $V_M$                                | $V_L - 0.5$ to $V_L + 26.0$      | V  |
| • Input voltage         | $V_I$                                | $V_{SS} - 0.5$ to $V_{DD} + 0.5$ | V  |
| • Output voltage        | $V_O$                                | $V_{SS} - 0.5$ to $V_{DD} + 0.5$ | V  |
| • Operating temperature | $T_{opr}$                            | -20 to +75                       | °C |
| • Storage temperature   | $T_{stg}$                            | -55 to +150                      | °C |

### Recommended Operating Conditions

|                         |                             |                |    |
|-------------------------|-----------------------------|----------------|----|
| • Supply voltage 1      | $V_{DDA}, V_{DDb}, V_{DDC}$ | 3.0 to 3.6     | V  |
| • Supply voltage 2      | $V_{DDD}$                   | 3.0 to 3.6     | V  |
| • Supply voltage 3      | $V_H$                       | 14.25 to 15.75 | V  |
| • Supply voltage 4      | $V_L$                       | -9.0 to -5.0   | V  |
| • Supply voltage 5      | $V_M$                       | 0              | V  |
| • Operating temperature | $T_{opr}$                   | -20 to +75     | °C |

Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

## Block Diagram

XSGA and XSGB are readout pulses that use V2A and V2B, respectively, as the VH value.

## Pin Configuration (Top View)

The enclosed pins use separate power supplies.

## Pin Description

| Pin No. | Symbol | I/O | Description                                                                                  |
|---------|--------|-----|----------------------------------------------------------------------------------------------|
| 1       | CKO    | O   | Oscillator output. (30.0MHz)                                                                 |
| 2       | Vss0   | —   | GND                                                                                          |
| 3       | CKI    | I   | Oscillator input. (30.0MHz)                                                                  |
| 4       | OSCO   | O   | Inverter output for oscillation. (30.0MHz)                                                   |
| 5       | OSCI   | I   | Inverter input for oscillation. (30.0MHz)                                                    |
| 6       | VDD0   | —   | Power supply.                                                                                |
| 7       | TEST1  | I   | Test. With pull-down resistor. Fix to low.                                                   |
| 8       | AVD0   | —   | Power supply.                                                                                |
| 9       | RG     | O   | Reset gate pulse output.                                                                     |
| 10      | Vss1   | —   | GND                                                                                          |
| 11      | Vss2   | —   | GND                                                                                          |
| 12      | H1     | O   | Clock output for horizontal CCD drive.                                                       |
| 13      | H2     | O   | Clock output for horizontal CCD drive.                                                       |
| 14      | AVD1   | —   | Power supply.                                                                                |
| 15      | XCPDM  | O   | Clamp pulse.                                                                                 |
| 16      | AVD2   | —   | Power supply.                                                                                |
| 17      | XSHP   | O   | Sample-and-hold pulse.                                                                       |
| 18      | XSHD   | O   | Sample-and-hold pulse.                                                                       |
| 19      | XRS    | O   | Sample-and-hold pulse.                                                                       |

|                      | VCML   |            |      |      | 1.0  | V    |

\*1 The MOS structure of this IC has a low tolerance for static electricity, so full care should be given for measures to prevent electrostatic discharge.

\*2 For noise and latch-up countermeasures, be sure to connect a bypass capacitor (0.1μF or more) between each power supply pin (V<sub>H</sub>, V<sub>L</sub>) and GND.

| th1    | SSI hold time, activated by the rising edge of SSK  | 20   |      |      | ns   |
| ts2    | SSK setup time, activated by the rising edge of SEN | 20   |      |      | ns   |
| th2    | SSK hold time, activated by the rising edge of SEN  | 20   |      |      | ns   |
| ts3    | SEN setup time, activated by the rising edge of SSK | 20   |      |      | ns   |
| fk     | SSK frequency                                       |      |      | 7.5  | MHz  |

## 2) Serial interface clock internal loading characteristics

### 3) Output timing characteristics using DSGAT and RST

H1 and H2 load capacitance = 180pF

EXP, XCPDM, PBLK, XSHP, XSHD, XRS and RG load capacitance = 10pF

(Within the recommended operating conditions)

| Symbol     | Definition                                                                             | Min. | Typ. | Max. | Unit |
|------------|----------------------------------------------------------------------------------------|------|------|------|------|
| $t_{pRST}$ | Time until the above outputs reach the specified value after the fall of DSGAT and RST |      |      | 75   | ns   |
| $t_{wRST}$ | RST and DSGAT pulse width                                                              | 10   |      |      | ns   |

### 4) FRI and HRI loading characteristics

MCK load capacitance = 10pF

(Within the recommended operating conditions)

| Symbol      | Definition                                                  | Min. | Typ. | Max. | Unit |
|-------------|-------------------------------------------------------------|------|------|------|------|
| $t_{sSYNC}$ | FRI and HRI setup time, activated by the rising edge of MCK | 5    |      |      | ns   |
| $t_{hSYNC}$ | FRI and HRI hold time, activated by the rising edge of MCK  | 5    |      |      | ns   |

## 5) Output variation characteristics of ID, WEN, EXP, FRO and HRO

EXP, ID and WEN load capacitance = 10pF

(Within the recommended operating conditions)

| Symbol     | Definition                                                          | Min. | Typ. | Max. | Unit |
|------------|---------------------------------------------------------------------|------|------|------|------|
| $tpdEXP$   | Time until the WEN, ID and EXP outputs change after the rise of MCK | 0.5  |      | 8.5  | ns   |
| $tpdSYNCO$ | Time until the FRO and HRO outputs change after the rise of MCK     | 1.0  |      | 11.5 | ns   |

## Description of Operation

### 1. Progressive Scan CCD drive pulse generation

- Combining this IC with a crystal oscillator generates a fundamental frequency of 30.0MHz.
- CCD drive pulse generation is synchronized with HRI and FRI.
- The CCD drive method can be changed to various modes by inputting serial data or parallel data to the CXD2457R.
- The various drive methods possessed by the CXD2457R are shown in the Timing Charts A-1 to 4 (V rate) and B-1 to 6 (H rate).

### 2. Serial data input method

- All CXD2457R operations can be controlled via the serial interface. The serial data format is as follows.

Serial data format

Serial data

| Data       | Symbol        | Function                                                                                                                      |                        | When reset |

#### CTGRY: Mode control data

|                                 | Detailed description                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <div>D11</div> <div>FHIGH</div> | <p>0: Power saving drive mode<br/>1: High-speed drive mode</p> <p>When FHIGH = 0, the clock input to CKI is immediately frequency divided by 1/3 and loaded internally.</p> <p>Mode switching timing<br/>(5 clocks after the fall of HRI just before XSG is generated)</p> <p>The high-speed phases of H1, H2, RG, XSHP, XSHD, XRS, ADCLK and other pulses are always logically the same phase with respect to MCK.</p> |
| <div>D12</div> <div>FINE</div>  | <p>0: DRAFT mode<br/>1: FINE mode</p> <p>In FINE mode, image data is taken by the normal Progressive Scan method.<br/>In DRAFT mode, image data is taken by pulse elimination readout. This enables a frame rate three times that during FINE mode. The mode is switched at the fall of HRI just before XSGA. Note that the FRO output is also switched accordingly. (DRAFT mode: 264H, FINE mode: 792H)</p>            |
| <div>D13</div> <div>NSG</div>   | <p>0: Normal operation<br/>1: Readout prohibited mode</p> <p>In readout prohibited mode, a readout pulse is not added to V2A and V2B (V2A or V2B takes a VH value). (V1, V2 and V3 are not modulated.)<br/>The mode is normally switched at the fall of HRI just before the position where the readout pulse is added.</p>                                                                                              |

|                              | Detailed description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | <p>0: Normal operation<br/>1: FS mode</p> <p>In order to increase the frame rate, a certain portion of the captured image of CCD can be cut out by performing high-speed sweep.</p> <p>In FS mode, high-speed sweep is performed for the V registers of the entire image (period Z) after FRI input. Next, high-speed sweep is performed again for only the desired period (period X) after generating the XSGA pulse. Then, after performing normal V transfer and outputting the effective signal (period Y), high-speed sweep is performed for the entire image again by inputting FRI at the desired timing. This makes it possible to take only the desired portion in the V direction, thus effectively increasing the frame rate.</p> <p>Operation is fixed during period Z, with 22 lines swept every 1H and repeating over a 36H period. During period X, first XSGA is generated, then sweep operation starts. This period is set in serial data FVFS (system setting data: D21 to D26) in HRI units.</p> <p>Be sure to set FINE = 0 in this mode.</p> |

### CXD2457R clock system

When using a 30MHz crystal

|       | FHIGH | 3MCK | FINE | MCK frequency | 2MCK pin output | Frame rate |
|-------|-------|------|------|---------------|-----------------|------------|
| Mode1 | 1     | 0    | 1    | 15MHz         | 30MHz           | 15Frame/s  |
| Mode2 | 1     | 1    | 0    | 10MHz         | 15MHz           | 30Frame/s  |
| Mode3 | 0     | 0    | 0    | 5MHz          | 10MHz           | 15Frame/s  |
| Mode4 | 1     | 0    | 0    | 15MHz         | 30MHz           | 45Frame/s  |
| Mode5 | 1     | 1    | 1    | 10MHz         | 15MHz           | 10Frame/s  |

**Note)** Combinations of FHIGH, 3MCK and FINE other than those listed above are prohibited.

High-speed and low-speed electronic shutter can be used together. Therefore, the exposure time is as follows:

$$\text{FR cycle} \times \text{VSHUT} + (\text{fv} - \text{HSUT}) \times \text{HR cycle} + 745/\text{MCK frequency [Hz]} = \text{Exposure time[second]}$$

(fv: Number of HR in 1FR)

#### 4. Shutter speed setting specifications when PS = H

When PS = H, the CXD2457R can be controlled without inputting serial data by using the SEN, SSK and SSI pins.

| Pin |                                           | When L                                                                                                                                                                                                                                                                                                                                                                                                                                      | When H                                                           |  |  |     |  |  |  |   |   |     |   |            |            |   |           |            |

Other registers hold the value input when PS = L, and assume the status indicated by STB when the RST pulse is input.

## 5. Reflective position of each data

Each serial data is reflected at the timing shown in the table below. The reflection position is the same when PS = H. When using the low-speed electronic shutter, the data is not reflected at FR where XSGA is not generated (a readout pulse is not added to V2A).

**Table 5-1. Serial data reflection timing**

| Data                                          | Reflection position                        |
|-----------------------------------------------|--------------------------------------------|
| Mode control data (STB)                       | SEN rise                                   |
| Mode control data (EXPXEN)                    | XSGA pulse rise                            |
| Mode control data (other than STB and EXPXEN) | HRI fall just before XSGA pulse generation |
| Electronic shutter control data               | HRI fall just after XSGA pulse generation  |
| High-speed phase adjustment data              | HRI fall just before XSGA pulse generation |
| System setting data (SGXEN)                   | SEN rise                                   |
| System setting data (other than SGXEN)        | HRI fall just before XSGA pulse generation |

## 6. RST pulse

Setting Pin 30 to low resets the system. The serial data values after reset are as shown in the "Serial data" table.

Also, some internal circuits stop operating when RST = L. For a description of the pin status when RST = L, see the "Pin status during operation control" table given in the detailed description of STB under "3. Serial data and description of functions".

## 7. DSGAT

DSGAT is ON when low and the CXD2457R is set to sleep mode as with SLP of STB.

Note that control is applied when either or both of DSGAT and SLP are ON. Also, when STN is ON, the CXD2457R is set to standby mode regardless of the DSGAT status.

## 8. EXP pulse

The EXP pulse indicates the exposure period.

The details are shown on the following pages.

(1)  $\text{HSHUT} \geq \text{MAX}$

(2)  $\text{HSHUT} \geq \text{MAX}$  (with low-speed electronic shutter)

(3)  $1 \leq \text{HSHUT} < \text{MAX}$

Numbers in parentheses are for FS mode.

(4)  $1 \leq \text{HSHUT} < \text{MAX}$  (with low-speed electronic shutter)(5)  $\text{HSHUT} = 0$ (6)  $\text{HSHUT} = 0$  (with low-speed electronic shutter)

Numbers in parentheses are for FS mode.

Chart A-1. FINE Mode (Vertical synchronization)

| Mode  |                                                                                                                                                                                                                                                                                                                                                 | DRAFT mode                                                                                                                                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Chart A-3. FS Mode (Vertical synchronization)

The mode is switched at the point where XSG is normally generated.

Chart A-4. FINE Mode (Vertical synchronization) Low-speed electronic shutter

Chart B-1. FINE Mode (Horizontal synchronization)

Chart B-2. DRAFT Mode (Horizontal synchronization)

Chart B-3. Readout Timing (FINE mode)

Chart B-4. Readout Timing (DRAFT mode)

Chart B-5. FS Mode: V clock continuous drive start (Horizontal synchronization)

Chart B-6. FS Mode: V clock continuous drive end (Horizontal synchronization)

Package Outline

Unit: mm

48PIN LQFP (PLASTIC)

DETAIL A

PACKAGE STRUCTURE

|            |                |
|------------|----------------|
| SONY CODE  | LQFP-48P-L01   |
| EIAJ CODE  | LQFP048-P-0707 |
| JEDEC CODE |                |

|                  |                          |
|------------------|--------------------------|
| PACKAGE MATERIAL | EPOXY RESIN              |
| LEAD TREATMENT   | SOLDER/PALLADIUM PLATING |
| LEAD MATERIAL    | 42/COPPER ALLOY          |
| PACKAGE MASS     | 0.2g                     |
