

GENERAL DESCRIPTION

The M928-02 is a PLL (Phase Locked Loop) based clock generator that uses an internal VCSO (Voltage Controlled SAW Oscillator) to produce a very low jitter output clock. From the M928-02-622.0800, an output clock frequency of 622.08MHz is provided from eight LVPECL clock output pairs. (Other frequencies are available; consult factory.) The accuracy of the output frequency is assured by the internal PLL that phase-locks the internal VCSO to the reference input frequency (19.44MHz for the M928-02-622.0800). The input reference can either be an external crystal, utilizing the internal crystal oscillator, or a stable external clock source such as a packaged crystal oscillator.

PIN ASSIGNMENT (9 x 9 mm SMT)

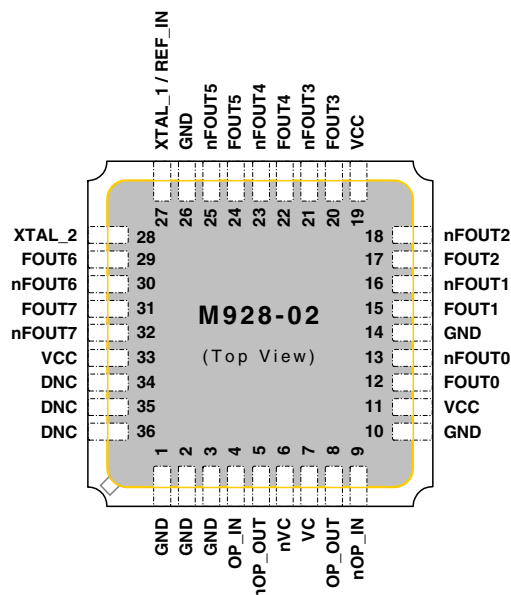

Figure 1: Pin Assignment

FEATURES

- ◆ Output clock frequency range 300MHz to 700MHz (Consult factory for frequency availability)
- ◆ Eight identical LVPECL output pairs
- ◆ Jitter 0.7ps rms (@622.08MHz, over 12kHz-20MHz), typ.
- ◆ Ideal for OC-48/STM-16 clock reference
- ◆ Output-to-output skew < 100ps
- ◆ External XTAL or LVCMOS reference input
- ◆ Integrated SAW (surface acoustic wave) delay line
- ◆ Single 3.3V power supply
- ◆ Small 9 x 9 mm SMT (surface mount) package

Example Output Frequency Configurations

PIN DESCRIPTIONS

Number	Name	I/O	Configuration	Description
1, 2, 3, 10, 14, 26	GND	Ground		Power supply ground connections.
4 9	OP_IN nOP_IN	Input		External loop filter connections. See Figure 5.
5 8	nOP_OUT OP_OUT	Output		
6 7	nVC VC	Input		
11, 19, 33	VCC	Power		Power supply connection, connect to +3.3V.
12, 13 15, 16 17, 18 20, 21 22, 23 24, 25 29, 30 31, 32	FOUT0, nFOUT0 FOUT1, nFOUT1 FOUT2, nFOUT2 FOUT3, nFOUT3 FOUT4, nFOUT4 FOUT5, nFOUT5 FOUT6, nFOUT6 FOUT7, nFOUT7	Output	No internal terminator	Clock output pairs, differential LVPECL output (622.08 MHz for the M928-02-622.0800)
27	XTAL_1 / REF_IN	Input		External crystal connection. Also accepts LVCMOS/LVTTL compatible clock source.
28	XTAL_2	Input		External crystal connection. Leave unconnected when driving pin 27 with external clock reference.
34, 35, 36	DNC		Do Not Connect.	Internal nodes. Connection to these pins can cause erratic device operation.

Table 2: Pin Descriptions

FUNCTIONAL DESCRIPTION

The M928-02 is a PLL (Phase Locked Loop) based clock generator that generates output clocks synchronized to an input reference clock.

The M928-02 combines the flexibility of a VCISO (Voltage Controlled SAW Oscillator) with the stability of a crystal oscillator.

Input Reference

The 19.44MHz input reference can either be an external, discrete crystal device or a stable external clock source such as a packaged crystal oscillator:

- If an external crystal is used with the on-chip crystal oscillator circuit (XTAL OSC), the external crystal should be a parallel-resonant, fundamental mode crystal. Apply it to the XTAL_1 / REF_IN and XTAL_2 input pins. External crystal load capacitors are also required.
- If an external LVCMOS/LVTTL clock source is used, apply it to the XTAL_1 / REF_IN input pin.

In either case, the reference clock is supplied directly to the phase detector of the PLL.

The PLL

The PLL (Phase Locked Loop) includes the phase detector, the VCISO, and a feedback divider (labeled "M Divider").

The feedback divider is a digital circuit that divides the VCISO output frequency by a numerical value "M" in order to match the input reference frequency.

By controlling the frequency and phase of the VCISO, the phase detector precisely locks the frequency and phase of the feedback divider output to that of the input reference. This creates an output frequency that is a multiple of the reference frequency (which is output from the VCISO).

The relationship between the VCISO output frequency, the M Divider, and the input reference frequency is defined as follows:

$$F_{\text{vcso}} = M \times F_{\text{xtal}}$$

For the M928-02-622.0800 (see "Ordering Information" on pg. 6):

- VCISO output frequency = 622.08MHz
- $M = 32$
- Input reference frequency = 19.44MHz

Therefore, for the M928-02-622.0800:

$$622.08\text{MHz} = 32 \times 19.44\text{MHz}$$

The VCISO center output frequency of 622.08MHz enables the product of $M \times$ input crystal frequency to fall within the lock range of the VCISO.

APPLICATION INFORMATION

This section includes information on the optional external crystal and on the external loop filter.

The subsections on the loop filter provide example component values and also briefly describe the SAW PLL simulator tool and additional application information available at www.icst.com.

External Crystal Specifications

If an external crystal is used with the on-chip crystal oscillator circuit (XTAL OSC), the external crystal should have the following general specifications:

Crystal Specifications

Parameter	Min	Typ	Max	Unit
Crystal Type	AT-cut quartz			
Mode of Oscillation	Fundamental			
f_0 Frequency Range	16		40	MHz
ESR Equivalent Series Resistance			50	Ω
Spurious Response (non-harmonic)			-40	dBc
C_L Load Capacitance, parallel load resonant	16		32	pF
P_0 Drive Level	0.1		1.0	mW

Table 3: Crystal Specifications

The external crystal will be applied to the XTAL_1 / REF_IN and XTAL_2 input pins. External crystal load capacitors are also required.

Recommended External Crystal Configuration

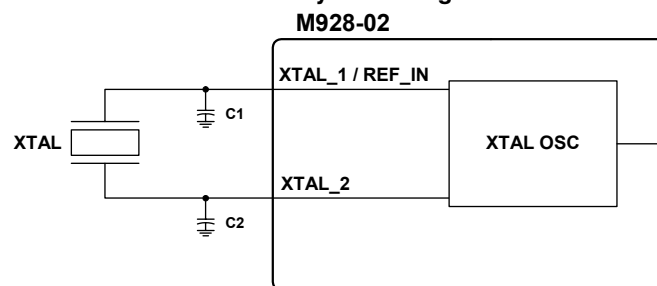

Figure 4: Recommended External Crystal Configuration

XTAL Load Capacitance Specification = 18 pF

C1 = 27 pF

C2 = 33 pF

External load capacitors C1 and C2 present a load of 15 pF to the crystal (they are seen in series by the crystal through the common ground connection). With the additional of PCB trace capacitance and M928-02 input capacitance, the total load to the crystal is about 18 pF.

External Loop Filter

To provide stable PLL operation, and thereby a low jitter output clock, the M928-02 requires the use of an external loop filter. This is provided via the provided filter pins (see Figure 5).

Figure 5: External Loop Filter

The loop filter is implemented as a differential circuit to minimize system noise interference. Due to the differential signal path design, the implementation requires two identical complementary RC filters as shown here.

See Table 4, Example External Loop Filter Component Values, below.

Example External Loop Filter Component Values

PLL Bandwidth (kHz)	Damping Factor	R loop (kΩ)	C loop (μF)	R post (kΩ)	C post (pF)
0.395	2.0	1.5	4.70	20	3300
1.2	2.9	4.7	1.00	20	1000
10 ¹	2.4	39.0	0.01	20	240

Table 4: Example External Loop Filter Component Values

Note 1: Recommended for minimum output jitter when using a crystal or crystal oscillator reference.

Refer to the M928-02 product web page at www.icst.com/products/summary/m928-02.htm for additional product information.

PLL Simulator Tool Available

A free PC software utility is available on the ICS website (www.icst.com). The M2000 Timing Modules PLL Simulator is a downloadable application that simulates PLL jitter and wander transfer characteristics. This enables the user to set appropriate external loop component values in a given application.

Refer to the SAW PLL Simulator Software web page at www.icst.com/products/calculators/m2000filterSWdesc.htm for additional information.

ABSOLUTE MAXIMUM RATINGS¹

Symbol	Parameter	Rating	Unit
V _I	Inputs	-0.5 to V _{CC} +0.5	V
V _O	Outputs	-0.5 to V _{CC} +0.5	V
V _{CC}	Power Supply Voltage	4.6	V
T _S	Storage Temperature	-45 to +100	°C

Table 5: Absolute Maximum Ratings

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in Recommended Conditions of Operation, DC Characteristics, or AC Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

RECOMMENDED CONDITIONS OF OPERATION

Symbol	Parameter	Min	Typ	Max	Unit
