MOS INTEGRATED CIRCUIT **μ PD160040A**

384-OUTPUT TFT-LCD SOURCE DRIVER (COMPATIBLE WITH 256-GRAY SCALES)

DESCRIPTION

The μ PD160040A is a source driver for TFT-LCDs capable of dealing with 256-gray scales. Data input is based on digital input configured as 8 bits by 6 dots (2 pixels), which can realize a full-color display of 16,777,216 colors by output of 256 values γ -corrected by an internal D/A converter and 8-by-2 external power modules.

Because the output dynamic range is as large as $V_{SS2} + 0.2$ V to $V_{DD2} - 0.2$ V, level inversion operation of the LCD's common electrode is rendered unnecessary. Also, to be able to deal with dot-line inversion, n-line inversion and column line inversion when mounted on a single side, this source driver is equipped with a built-in 8-bit D/A converter circuit whose odd output pins and even output pins respectively output gray scale voltages of differing polarity.

(1/2)

Pin Symbol	Pin Name	I/O	Description
S ₁ to S ₃₈₄	Driver	Output	The D/A converted 256-gray-scale analog voltage is output.
D ₀₀ to D ₀₇	Port 1 display data	Input	The display data is input with a width of 48 bits, viz., the gray scale data (8 bits) by 6 dots (2 pixels). D _{x0} : LSB, D _{x7} : MSB
D ₁₀ to D ₁₇			
D ₂₀ to D ₂₇			
D ₃₀ to D ₃₇	Port 2 display data	Input	
D ₄₀ to D ₄₇			
D ₅₀ to D ₅₇			
R/L	Shift direction control	Input	The shift direction control pin of shift register. The shift directions of the shift registers are as follows. R/L = H (right shift): STHR input → S ₁ → S ₃₈₄ → STHL output R/L = L (left shift) : STHL input → S ₃₈₄ → S ₁ → STHR output
STHR	Right shift start pulse	I/O	These are the start pulse input/output pins when connected in cascade. Loading of display data starts when a high level is read at the rising edge of CLK. At the rising edge of the 64th clock after the start pulse input, the start pulse output reaches the high level, thus becoming the start pulse of the next-level driver.
STHL	Left shift start pulse	I/O	For right shift, STHR is input and STHL is output. For left shift, STHL is input and STHR is output.
CLK	Shift clock	Input	The shift clock input pin of shift register. The display data is loaded into the data register at the rising edge. When 66 clock pulses are input after input of the start pulse, input of display data is halted automatically. The contents of the shift register are cleared at the STB's rising edge.
STB	Latch	Input	The contents of the data register are transferred to the latch circuit at the rising edge. In addition, at the falling edge, the gray scale voltage is supplied to the driver. It is necessary to ensure input of one pulse per horizontal period.
SRC	Slew-rate control	Input	SRC = H: High-slew-rate mode (large current consumption) SRC = L: Low-slew-rate mode (small current consumption) SRC is pulled up to the V _{DD1} in the IC.
ORC	Output resistance control	Input	ORC = H: Low output resistance mode ORC = L: High output resistance mode ORC is pulled up to the V _{DD1} in the IC.
POL	Polarity	Input	POL = L: The S _{2n-1} output uses V ₀ -V ₇ as the reference supply. The S _{2n} output uses V ₈ -V ₁₅ as the reference supply. POL = H: The S _{2n-1} output uses V ₈ -V ₁₅ as the reference supply. The S _{2n} output uses V ₀ -V ₇ as the reference supply. S _{2n-1} indicates the odd output and S _{2n} indicates the even output. Input of the POL signal is allowed the setup time (t _{POL-STB}) with respect to STB's rising edge. When it switches such as POL = H→L or L→H, all output pins are output reset during STB = H. When it does not switch, all output pins become Hi-Z (High impedance) during STB = H. Refer to 7. RELATIONSHIP BETWEEN MODE, STB, SRC, ORC, POL AND OUTPUT WAVEFORM for details.

(2/2)

Pin Symbol	Pin Name	I/O	Description
MODE	Output reset control	Input	MODE = H or open: Output reset MODE = L: No output reset MODE is pulled up to the V_{DD1} in the IC.
POL21, POL22	Data inversion	Input	Select of inversion or no inversion for input data. POL21: Data inversion or no inversion of Port1. POL22: Data inversion or no inversion of Port2 POL21, POL22 = H: Data are inverted in the IC. POL21, POL22 = L: Data are not inverted in the IC.
V_{SEL}	Driver voltage select	Input	The driver voltage can be switched by controlling the stationary bias current of the output amplifier via V_{SEL} . $V_{SEL} = H$: $V_{DD2} = 12.5$ to (14.0 V) (Large bias current) $V_{SEL} = L$ or open: $V_{DD2} = (14.0 \text{ V})$ to 15.5 V (Small bias current) LPC is pulled down to the V_{SS1} in the IC.
V_0-V_{15}	γ -corrected power supplies	—	Input the γ -corrected power supplies from outside by using operational amplifier. During the gray scale voltage output, be sure to keep the gray scale level power supply at a constant level. Make sure to maintain the following relationships. $V_{DD2} - 0.2 \text{ V} \geq V_0 > V_1 > V_2 > \dots > V_6 > V_7 \geq 0.5 V_{DD2} + 0.5 \text{ V}$ $0.5 V_{DD2} - 0.5 \text{ V} \geq V_8 > V_9 > V_{10} > \dots > V_{14} > V_{15} \geq V_{SS2} + 0.2 \text{ V}$
TEST	Test	I	Normally, set the TEST pin to high level or leave open. This pin is pulled up to V_{DD1} in the IC.
V_{DD1}	Logic power supply	—	2.5 to 3.6 V
V_{DD2}	Driver power supply	—	12.5 to 15.5 V
V_{SS1}	Logic ground	—	Grounding
V_{SS2}	Driver ground	—	Grounding

Cautions 1. The power start sequence must be V_{DD1} , logic input, and V_{DD2} & V_0-V_{15} in that order.

Reverse this sequence to shut down.

2. To stabilize the supply voltage, please be sure to insert a 0.47 μF bypass capacitor between $V_{DD1}-V_{SS1}$ and $V_{DD2}-V_{SS2}$. Furthermore, for increased precision of the D/A converter, insertion of a bypass capacitor of about 0.1 μF is also advised between the γ -corrected power supply terminals ($V_0, V_1, V_2, \dots, V_{15}$) and V_{SS2} .

5. RELATIONSHIP BETWEEN INPUT DATA AND OUTPUT VOLTAGE VALUE

The μ PD160040A incorporates a 8-bit D/A converter whose odd output pins and even output pins output respectively gray scale voltages of differing polarity with respect to the LCD's counter electrode voltage. The D/A converter consists of ladder resistors and switches.

The ladder resistors (r_0 to r_{253}) are designed so that the ratio of LCD panel (γ -compensated voltages to V_0 '- V_{255}' and V_0 "- $V_{255}"$ is almost equivalent as shown in Figure 5-2. For the 2 sets of eight γ -compensated power supplies, V_0 - V_7 and V_8 - V_{15} , respectively, input gray scale voltages of the same polarity with respect to the 0.5 V_{DD2} .

Figure 5-1 shows the relationship between the driving voltages such as liquid-crystal driving voltages V_{DD2} , V_{SS2} and 0.5 V_{DD2} , and γ -corrected voltages V_0 - V_{15} and the input data. Be sure to maintain the voltage relationships below.

$$V_{DD2} - 0.2 \text{ V} \geq V_0 > V_1 > V_2 > V_3 > V_4 > V_5 > V_6 > V_7 \geq 0.5 V_{DD2} + 0.5 \text{ V}$$

$$0.5 V_{DD2} - 0.5 \text{ V} \geq V_8 > V_9 > V_{10} > V_{11} > V_{12} > V_{13} > V_{14} > V_{15} \geq 0.5 V_{SS2} + 0.2 \text{ V}$$

Also, V_6 - V_7 and V_8 - V_9 are left open in the IC. Be sure to input the gray scale level power supply at a constant level to the all pins, as V_0 - V_{15} .

Figures 5-2 shows γ Corrected Voltages and Ladder Resistors Ratio and figure 5-3 shows the relation ship between the input data and the output voltage (POL21, POL22 = L).

7. RELATIONSHIP BETWEEN MODE, STB, SRC, ORC, POL AND OUTPUT WAVEFORM

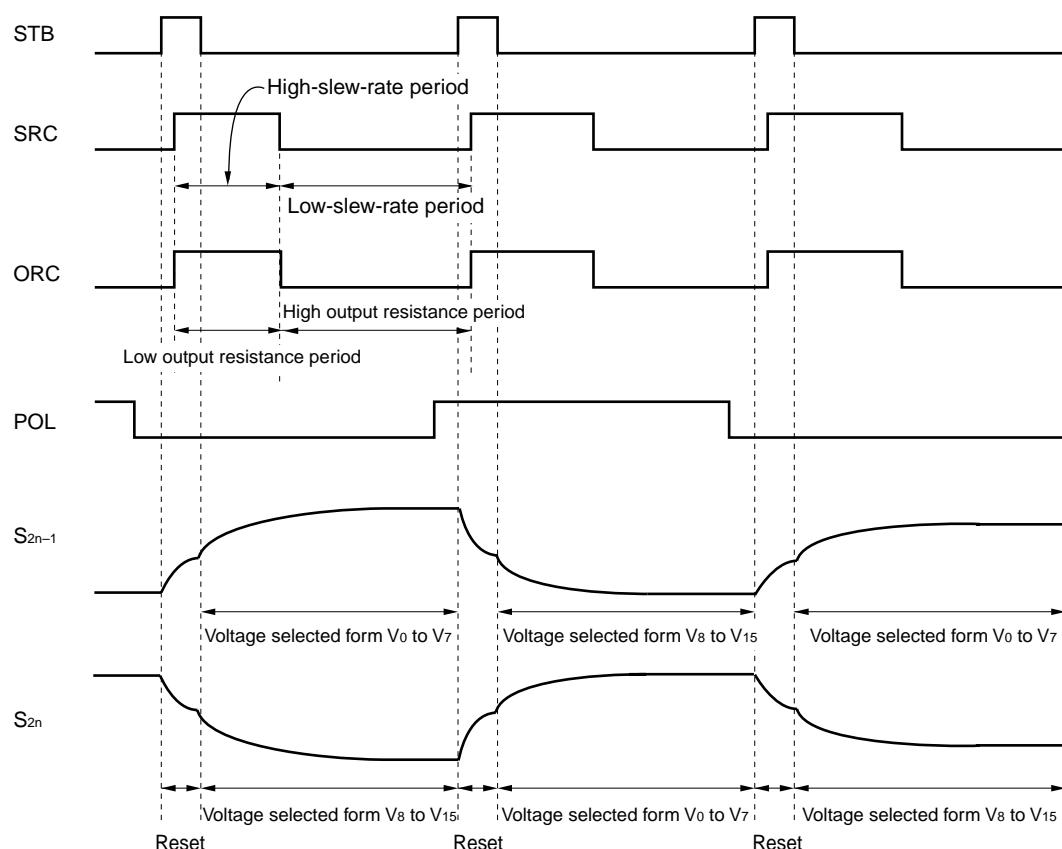

When MODE = H or open and STB is high level, all outputs are reset (shorted) and the gray-scale voltage is output to LCD in synchronization with the falling edge of STB.

When MODE = L and STB is high level, all outputs became Hi-Z and the gray-scale voltage is output to the LCD in synchronization with the falling edge of STB.

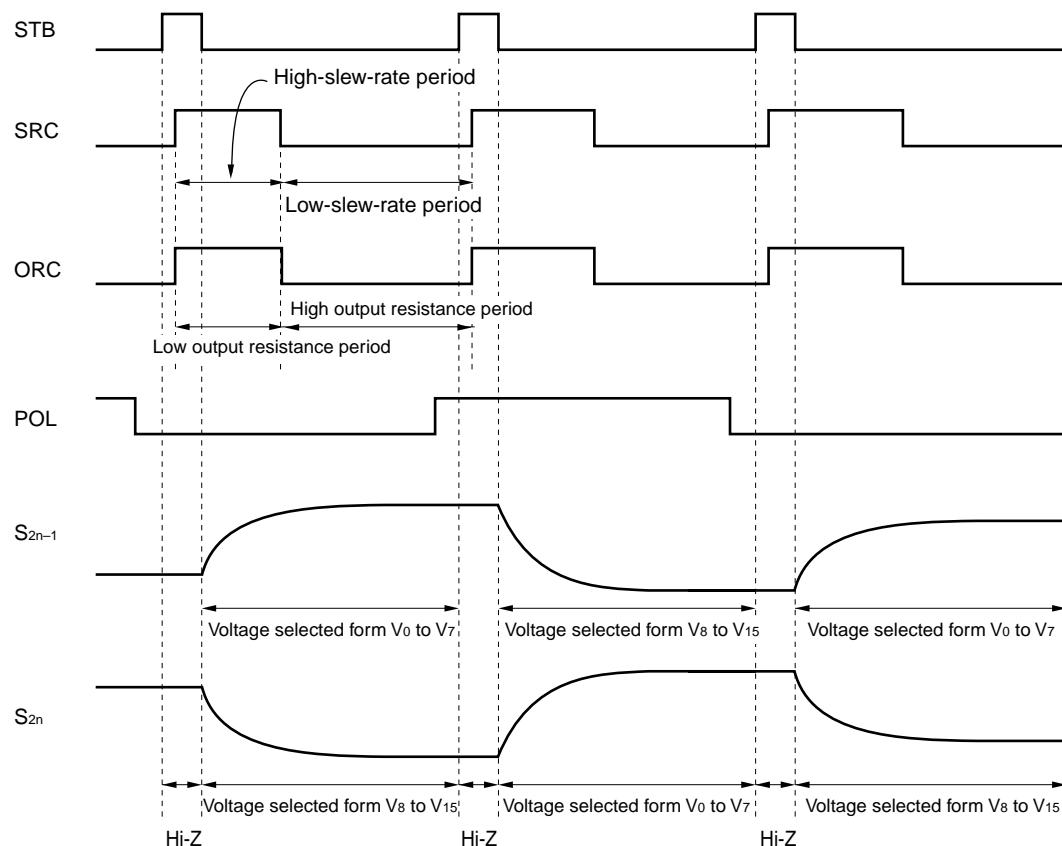

Also, setting the SRC pin to high level allows the bias current value of the output amplifier to rise temporarily, and setting the ORC pin to high level allows the output resistance value of the amplifier to lower temporarily.

For the timing and the processing of STB, SRC, or ORC during a high-level period, We recommend a thorough evaluation of the LCD panel specifications in advance.

NOTES FOR CMOS DEVICES**① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.
