

# Proprietary 32-bit Microcontroller

CMOS

## FR60 MB91310 Series

### MB91F312A/FV310A

#### ■ DESCRIPTION

The FR families are lines of single-chip microcontrollers based on a 32-bit high-performance RISC CPU, incorporating a variety of I/O resources for embedded control applications which require high CPU performance for high-speed processing.

The FR families are best suited for embedded applications which require high-performance CPU power for processing, such as TV and POP control.

Based on the FR30/FR40 family CPU, this FR60 family is enhanced in bus access for use in faster applications.

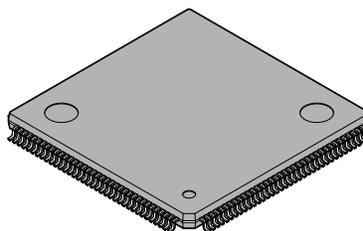

#### ■ FEATURE

- FR CPU
  - 32-bit RISC, load/store architecture with a five-stage pipeline
  - Operating frequency: 40 MHz (using PLL at an oscillation frequency of 10 MHz)
  - 16 - bit fixed length instructions (basic instructions), 1 instruction per cycle
  - Instruction set optimized for embedded applications: Memory-to-memory transfer, bit manipulation, barrel shift etc.

(Continued)

#### ■ PACKAGE

144-pin plastic LQFP

(FTP-144P-M08)

# MB91310 Series

- Instructions adapted for high-level languages: Function entry/exit instructions, multiple-register load/store instructions
  - Register interlock functions: Facilitating coding in assemblers
  - On-chip multiplier supported at the instruction level.
    - Signed 32-bit multiplication: 5 cycles.
    - Signed 16-bit multiplication: 3 cycles
  - Interrupt (PC, PS save): 6 cycles, 16 priority levels
  - Harvard architecture allowing program access and data access to be executed simultaneously
  - Instruction prefetch function implemented by a four-word queue in the CPU
  - Instruction compatible with FR family
- Bus interface

This bus interface is used for macro connection. (USB, MS-IF, OSDC)

    - Operating frequency Max 20 MHz
    - 16-bit data input/output (Interface to the USB, MS-IF, and OSDC)
    - Chip-select signals can be output for completely independent eight areas allocatable in a minimum of 64 KB. The  $\overline{CS1}$ ,  $\overline{CS2}$ , and  $\overline{CS3}$  areas are reserved as follows.  $\overline{CS0}$ ,  $\overline{CS4}$ , to  $\overline{CS7}$  are Musable.
      - $\overline{CS1}$  area : USB host
      - $\overline{CS2}$  area : USB function
      - $\overline{CS3}$  area : MS-IF, OSDC
    - Basic bus cycle : 2 cycles
    - Programmable automatic wait cycle generator capable of inserting wait cycles for each area  $\overline{CS1}$ ,  $\overline{CS2}$  and  $\overline{CS3}$  are reserved; their settings are fixed.
- Built-in RAM
    - 16 KB built RAM capacity
    - This RAM can be used as instruction RAM by writing instruction code as well as data.
  - DMAC (DMA Controller)
    - Connected to five channels (ch0, ch1 → USB function; ch2 → MS-IF).
    - 3 forwarding factors (internal peripheral/software)
    - Addressing using 32 - bit full addressing mode (increment, decrement, fixed)
    - Demand transfer, burst transfer, step transfer, or block transfer
    - Selectable transfer data size: 8-bit, 16-bit, or 32-bit
  - Bit search module (for REALOS)
    - Search for the position of the bit 1/0-changed first in one word from the MSB
  - Reload timer (including 1 channel for REALOS)
    - 16-bit PPG timer ch3
    - The internal clock is optional from 2/8/32 en surroundings.

(Continued)

- UART
  - Full duplex double buffer
  - UART : 5 channels
  - With parity / no parity selection
  - Asynchronous (start - stop synchronized) or CLK - synchronous communications selectable
  - Internal timer for dedicated baud rate
  - External clock can be used as transfer clock
  - Assorted error detection functions (for parity, frame, and overrun errors)
- I<sup>2</sup>C Interface
  - Four channels are incorporated. (ch3 can be used as two ports.)
  - Master/slave sending and receiving
  - Clock synchronization function
  - Detecting transmitting direction function
  - Bus error detection function
  - Standard mode (Max 100 Kbps)/High speed mode (Max 400 Kbps) supported
  - Arbitration function
  - Slave address and general call address detection function
  - Start condition repeat generation and detection function
  - 10 bit/7 bit slave address
- Interrupt controller
  - A total of five external interrupt lines are provided (1 nonmaskable interrupt pin ( $\overline{\text{NMI}}$ ) and 4 normal interrupt pins ( $\overline{\text{INT3}}$  to  $\text{INT0}$ ).
  - Interrupt from internal peripheral devices.
  - Programmable priorities (16 levels) for all interrupts except the non - maskable interrupt
  - Available for wakeup from STOP mode
- A/D converter
  - 10-bit resolution. 10 channels
  - Successive comparator type, conversion time : approx. 10  $\mu\text{s}$
  - Conversion modes (Single conversion mode, Scan conversion mode)
  - Startup sources (software and external triggers)
- PPG
  - 4 channels
  - Six-bit down-counter, 16-bit data register with cycle setting buffer
  - The internal clock is optional from 1/4/16/64 en surroundings.
- PWC
  - One channel (input) incorporated
  - 16 bits up counter
  - Simple LFP digital filter incorporated
- Timer
  - Lowpass filter eliminating noise below the clock setting
  - Capable of pulse width measurement according to fine settings using seven types of clock signals
  - Event count function based on pin input
  - Interval timer function using seven different clocks and one external input clock

(Continued)

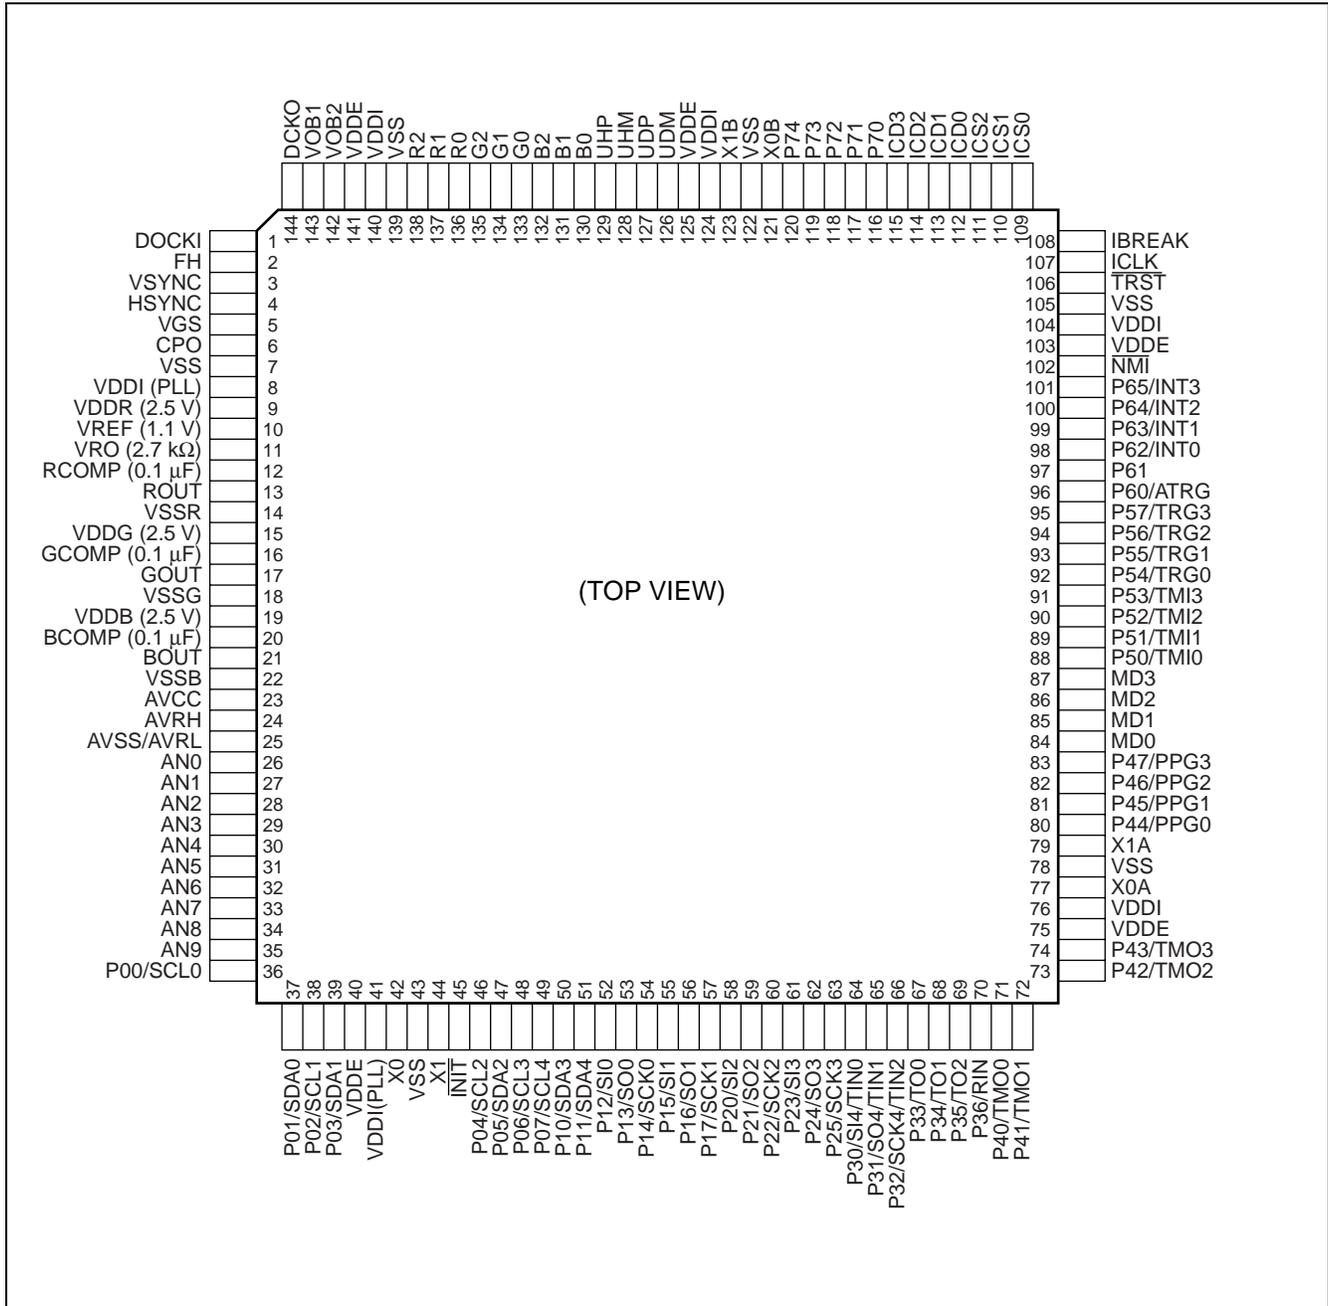

# MB91310 Series

(Continued)

- USB host function
  - U.S.B 1.0 Specification
  - 8 KB of internal RAM for parameters
- USB function
  - USB 1.1 compliant full-speed double buffering
  - CONTROL IN/OUT, BULK IN/OUT, INTERRUPT IN
- OSDC function
  - High-quality OSDC integrated
  - Analog RGB interface (with internal DAC)
  - Digital RGB I/F
  - Internal dot clock generator PLL
- Other internal times
  - 16-bit PPG timer ch3(u-timer)
  - Watch dog timer
- I/O port
  - Max 72 ports
- Other features
  - Internal oscillator circuit as clock source
  - $\overline{\text{INIT}}$  is prepared as a reset terminal.
  - Watchdog timer reset. Software reset.
  - Low power consumption modes supported: Stop mode and Sleep mode
  - Gear function
  - Built-in time base timer
  - Package : LQFP-144, 0.5 mm pitch, 20 mm × 20 mm
  - CMOS technology (0.25  $\mu\text{m}$ )
  - Supply voltage: Dual power supplies at 3.3 V  $\pm$  0.3 V, 2.5 V  $\pm$  0.2 V

THE I<sup>2</sup>C LICENSE : "Purchase of Fujitsu I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent Rights to use, these components in an I<sup>2</sup>C system provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips."

## PIN ASSIGNMENT

# MB91310 Series

## ■ PIN DESCRIPTION

Pin no.	Pin name	Circuit type	Description
1	DOCKI	D	Dot clock input
2	FH	D	Vertical synchronous output
3	VSYNC	D	Horizontal synchronous input
4	HSYNC	D	Vertical synchronous input
5	VGS	—	Device Ground
6	CPO	K	Charge pump output
7	VSS	—	Dot clock PLL ground
8	VDDI (PLL)	—	Dot clock PLL power supply
9	VDDR (2.5 V)	—	D/A power supply for R
10	VREF (1.1 V)	K	Voltage reference input
11	VRO (2.7 kΩ)	K	Resistor connection pin
12	RCOMP (0.1 μF)	K	Capacitor connection pin
13	ROUT	K	R output (Analog)
14	VSSR	—	D/A Ground for R
15	VDDG (2.5 V)	—	D/A power supply for G
16	GCOMP (0.1 μF)	K	Capacitor connection pin
17	GOUT	K	G output (Analog)
18	VSSG	—	Device Ground for G
19	VDDB (2.5 V)	—	D/A power supply for B
20	BCOMP (0.1 μF)	K	Capacitor connection pin
21	BOUT	K	B output (Analog)
22	VSSB	—	D/A Ground for B
23	AVCC	—	A/D Power Supply
24	AVRH	—	A/D referense power supply
25	AVSS/AVRL	—	A/D Ground
26	AN0	E	Analog input
27	AN1	E	Analog input
28	AN2	E	Analog input
29	AN3	E	Analog input
30	AN4	E	Analog input
31	AN5	E	Analog input
32	AN6	E	Analog input
33	AN7	E	Analog input
34	AN8	E	Analog input
35	AN9	E	Analog input

## ■ HANDLING DEVICES

- Preventing Latchup

Latch-up may occur in a CMOS IC if a voltage greater than  $V_{CC}$  or less than  $V_{SS}$  is applied to an input or output pin or if an above-rating voltage is applied between  $V_{CC}$  and  $V_{SS}$ . A latchup, if it occurs, significantly increases the power supply current and may cause thermal destruction of an element. When you use a CMOS IC, be very careful not to exceed the maximum rating.

- Treatment of Unused Input Pins

Do not leave an unused input pin open, since it may cause a malfunction. Handle by, for example, using a pull-up or pull-down resistor.

- About Power Supply Pins

If there are multiple  $V_{CC}$  and  $V_{SS}$  pins, from the point of view of device design, pins to be of the same potential are connected the inside of the device to prevent such malfunctioning as latch up. To reduce unnecessary radiation, prevent malfunctioning of the strobe signal due to the rise of ground level, and observe the standard for total output current, be sure to connect the  $V_{CC}$  and  $V_{SS}$  pins to the power supply and ground externally. The power pins should be connected to  $V_{CC}$  and  $V_{SS}$  of this device at the lowest possible impedance from the current supply source.

It is also advisable to connect a ceramic bypass capacitor of approximately  $0.1\mu\text{F}$  between  $V_{CC}$  and  $V_{SS}$  near this device.

- About Crystal Oscillator Circuit

Noise near the X0 and X1 pin may cause the device to malfunction. When designing a PC board using the device, place the X0 and X1 pins, the crystal (or ceramic) oscillator, and the bypass capacitor leading to the ground as close to one another as possible.

It is strongly recommended to design PC board so that X0 and X1 pins are surrounded by grounding area for stable operation.

- About Mode Pins (MD0 to MD3)

These pins should be connected directly to  $V_{CC}$  or  $V_{SS}$ . To prevent the device erroneously switching to test mode due to noise, design the printed circuit board such that the distance between the mode pins and  $V_{CC}$  or  $V_{SS}$  is as short as possible and the connection impedance is low.

- About Tool Reset Pin ( $\overline{\text{TRST}}$ )

This pin must input the same signal as that to  $\overline{\text{INIT}}$  when the tool is not used. Apply the same treatment to mass-produced products as well.

- Operation at Start-up

A setting initialization reset (INIT) must always be performed via the  $\overline{\text{INIT}}$  pin immediately after the power supply is turned on or recycled.

Immediately after the power supply is turned on, hold the Low level input to the  $\overline{\text{INIT}}$  pin for the settling time required for the oscillator circuit to take the oscillation stabilization wait time for the oscillator circuit. (For INIT via the  $\overline{\text{INIT}}$  pin, the oscillation stabilization wait time setting is initialized to the minimum value.)

- Oscillation Input at Power-ON

When turning the power on, maintain clock input until the device is released from the oscillation stabilization wait state.

- Notes on Power-ON/shut-down

Cautions to take when turning on/off VDDI (2.5-V internal power supply) and VDDE (3.3-V external-pin power supply)

Do not apply VDDE (external) alone continuously (for over an indication of one minute) with VDDI (internal) disconnected not to cause a reliability problem with the LSI.

When VDDE (external) returns from the OFF state to the ON state, the circuit may fail to hold its internal state, for example, due to power supply noise.

---

When the power is turned on    VDDI (internal)→Analog→VDDE (external)→Signal

When the power is turned off    Signal→VDDE (external)→Analog→VDDI (internal)

---

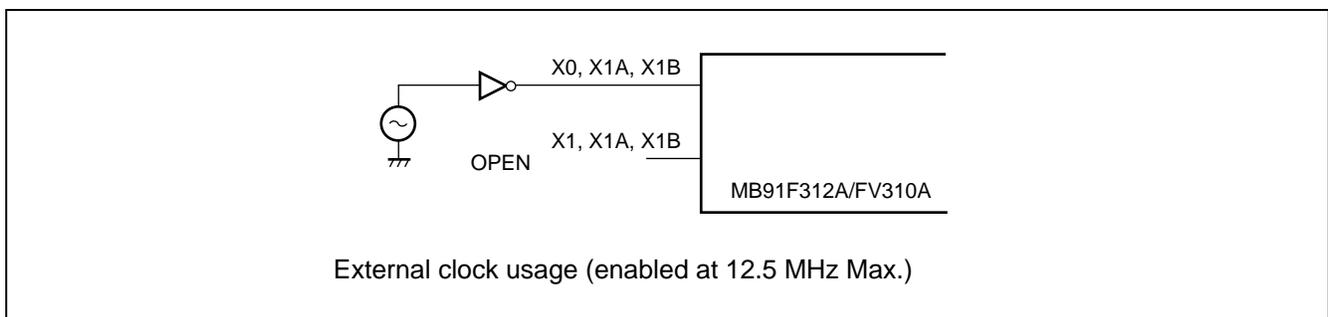

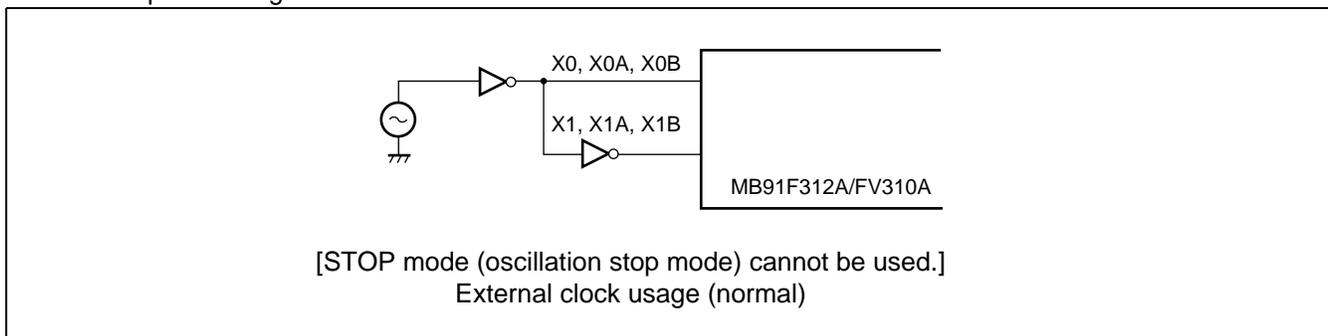

- Undefined Output on Power-ON

When the power supply is turned on, the output pin may remain indeterminate until the internal power supply becomes stable.

- About the attention when the external clock is used

When the external clock is used, in principle, supply a clock signal to the X0 (X0A, X0B) pin and an opposite-phase clock signal to the X1 (X1A, X1B) pin at the same time. However, In this case. the stop mode must not be used.(This is because, in STOP mode, the X1 (X1A, X1B) pin stops at "H" output.) At 12.5 MHz or less, the device can be used with the clock signal supplied only to the X0 (X0A, X0B) pin.

An example of using the external clock is illustrated below.

Note : The X1 (X1A, X1B) pin must be designed to have a delay within 15 ns, at 10 MHz, from the signal to the X0 (X0A, X0B) pin.

# MB91310 Series

- Restrictions

Common in the MB91310 series

(1) Clock Control Block

Take the oscillation stabilization wait time during Low level input to the  $\overline{\text{INIT}}$  pin.

(2) Bit Search Module

The 0-detection data register (BSD0), 1-detection data register (BSD1), and transition-detection data register (BSDC) are only word-accessible.

(3) I/O Port

Ports are accessed only in bytes.

(4) Low Power Consumption Mode

To enter the standby mode, use the synchronous standby mode (set with the SYNC\_S bit as bit 8 in the TBCR, or time-base counter control register) and be sure to use the following sequence:

(LDI #value\_of\_standby, R0)

(LDI #\_STCR, R12)

STB R0, @R12 : Write to standby control register (STCR)

LDUB @R12, R0 : STCR lead for synchronous standby

LDUB @R12, R0 : Dummy re-lead of STCR

NOP : NOP  $\times$  5 for timing adjustment

NOP

NOP

NOP

NOP

In addition, set the I-flag and the ILM and ICR registers to branch to an interrupt handler when the interrupt handler triggers the microcontroller to return from the standby mode.

Please do not do the following when the monitor debugger is used.

- Set a break point within the above array of instructions.
- Single-step the above instructions.

(5) Pre-fetch

When accessing a prefetch-enabled little endian area, be sure to use word access (in 32-bit, word length) only. Byte or half-word access results in wrong data read.

(6) Notes on the PS register

As the PS register is processed by some instructions in advance, exception handling below may cause the interrupt handling routine to break when the debugger is used or the display contents of flags in the PS register to be updated.

As the microcontroller is designed to carry out reprocessing correctly upon returning from such an EIT event, it performs operations before and after the EIT as specified in either case.

1. The following operations are performed when (c) the instruction followed by a data event or a DIVOU/DIVOS emulator menu instruction (a) receives a user interrupt or NMI or (b) breaks when single-stepped.

- The D0 and D1 flags are updated in advance.
  - An EIT handling routine (user interrupt, NMI, or emulator) is executed.
  - Upon returning from the EIT, the DIVOU/DIVOS instruction is executed and the D0 and D1 flags are updated to the same values as in (1).
2. The following operations are performed when the ORCCR/STILM/MOV Ri and PS instructions are executed.
- The PS register is updated in advance.
  - An EIT handling routine (user interrupt or NMI) is executed.
  - Upon returning from the EIT, the above instructions are executed and the PS register is updated to the same value as in (1).

## (7) Watchdog Timer

The watchdog timer built in this model monitors a program to check that it defers a reset within a certain period of time. The watchdog timer resets the CPU if the program runs out of controls, preventing the reset defer function from being executed. Once the function of the watchdog timer is enabled, therefore, the watchdog timer keeps on watching programs until it resets the CPU.

As an exception, the watchdog timer defers a reset automatically under the condition in which the CPU stops program execution. Refer to the watchdog timer function description for the exceptional condition.

If the system runs out of control and develops the above condition, a watchdog reset may not be generated. In that case, please reset (INIT) by external  $\overline{\text{INIT}}$  terminal.

## (8) Notes on using the A/D converter

The MB91310 series contains an A/D converter. Supply power to the AV<sub>CC</sub> at 3.3 V.

Unique to the evaluation chip MB91FV310A

### (1) Simultaneous occurrences of a software break and a user interrupt/NMI

If a software break and a user interrupt/NMI occurs simultaneously, the emulator debugger may react as follows.

- The debugger stops pointing to a location other than the programmed break points.
- The halted program is not re - executed correctly.

If this symptom occurs, use a hardware break in place of a hardware break. If you use the monitor debugger, do not set a break point within the relevant array of instructions.

### (2) Single-stepping of the RETI instruction

If an interrupt occurs frequently during single stepping, execute only the relevant processing routine repeatedly after single-stepping RETI. This will prevent the main routine and low-interrupt-level programs from being executed. Do not single-step the RETI instruction for avoidance purposes. When the debugging of the relevant interrupt routine becomes unnecessary, perform debugging with that interrupt disabled.

### (3) About an Operand Break

Do not apply a data event break to access to the area containing the address of a stack pointer.

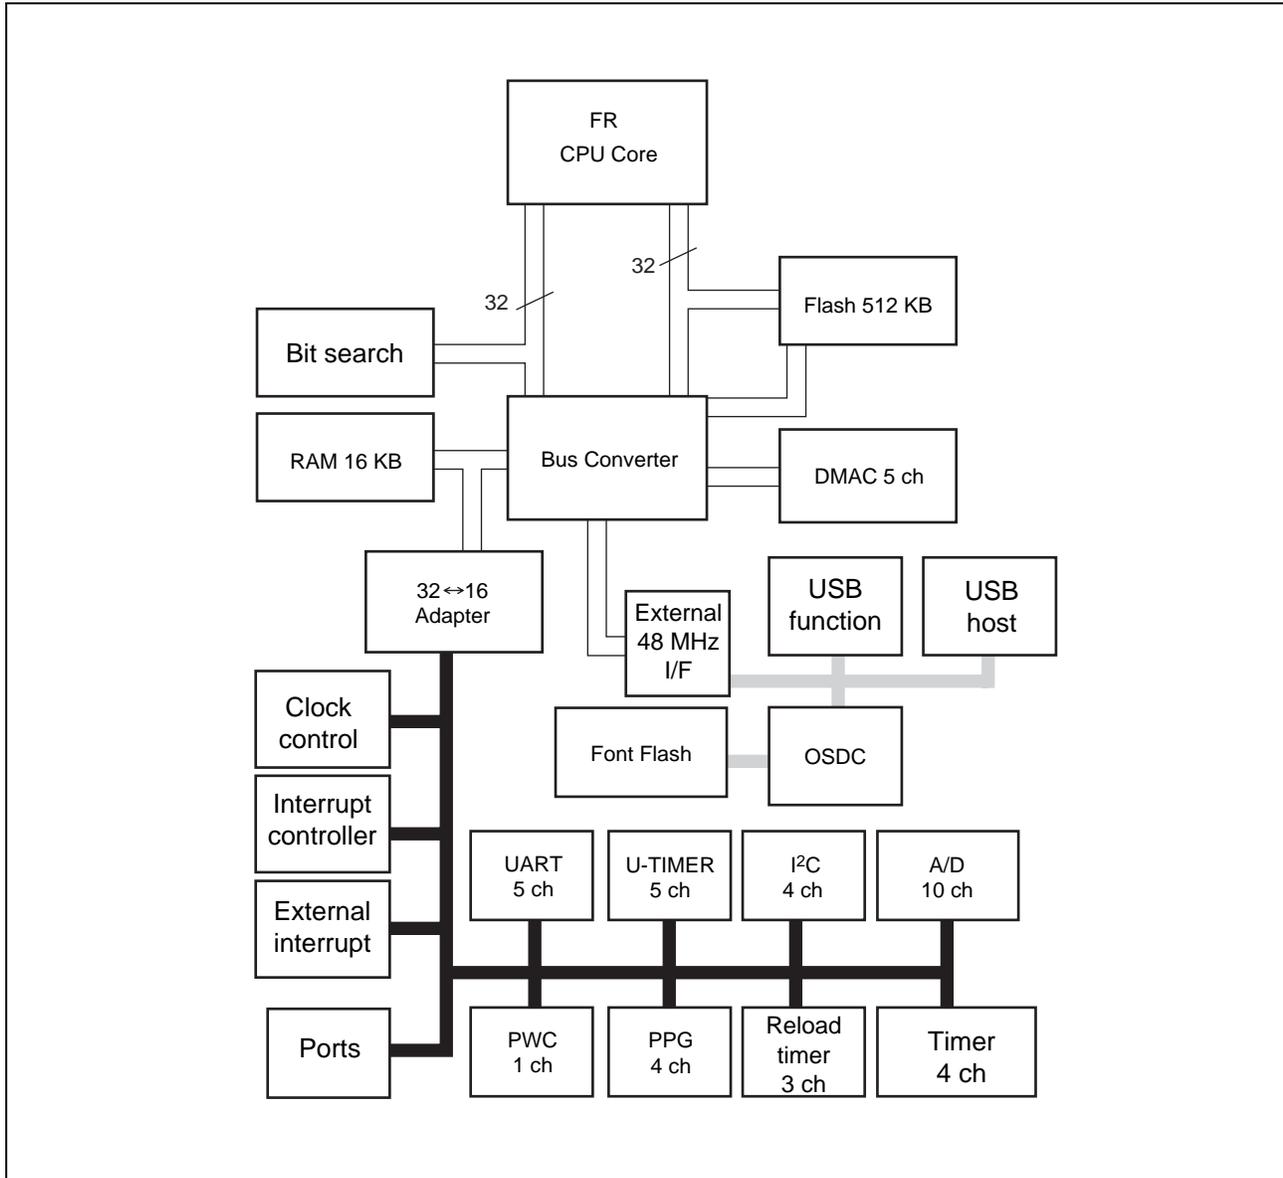

### (4) Sample Batch File for Configuration

To debug a program downloaded to internal RAM, be sure to execute the following batch file after executing RESET.

```
# Set MODR (0x7fd) = Enable In memory + 16-bit External Bus
set mem/byte 0x7fd = 0x5
```

# MB91310 Series

## ■ BLOCK DIAGRAM

## ■ MEMORY SPACE

### 1. Memory space

The FR family has 4 Gbytes of logical address space ( $2^{32}$  addresses) available to the CPU by linear access.

#### Direct Addressing Areas

The following address space areas are used as I/O areas.

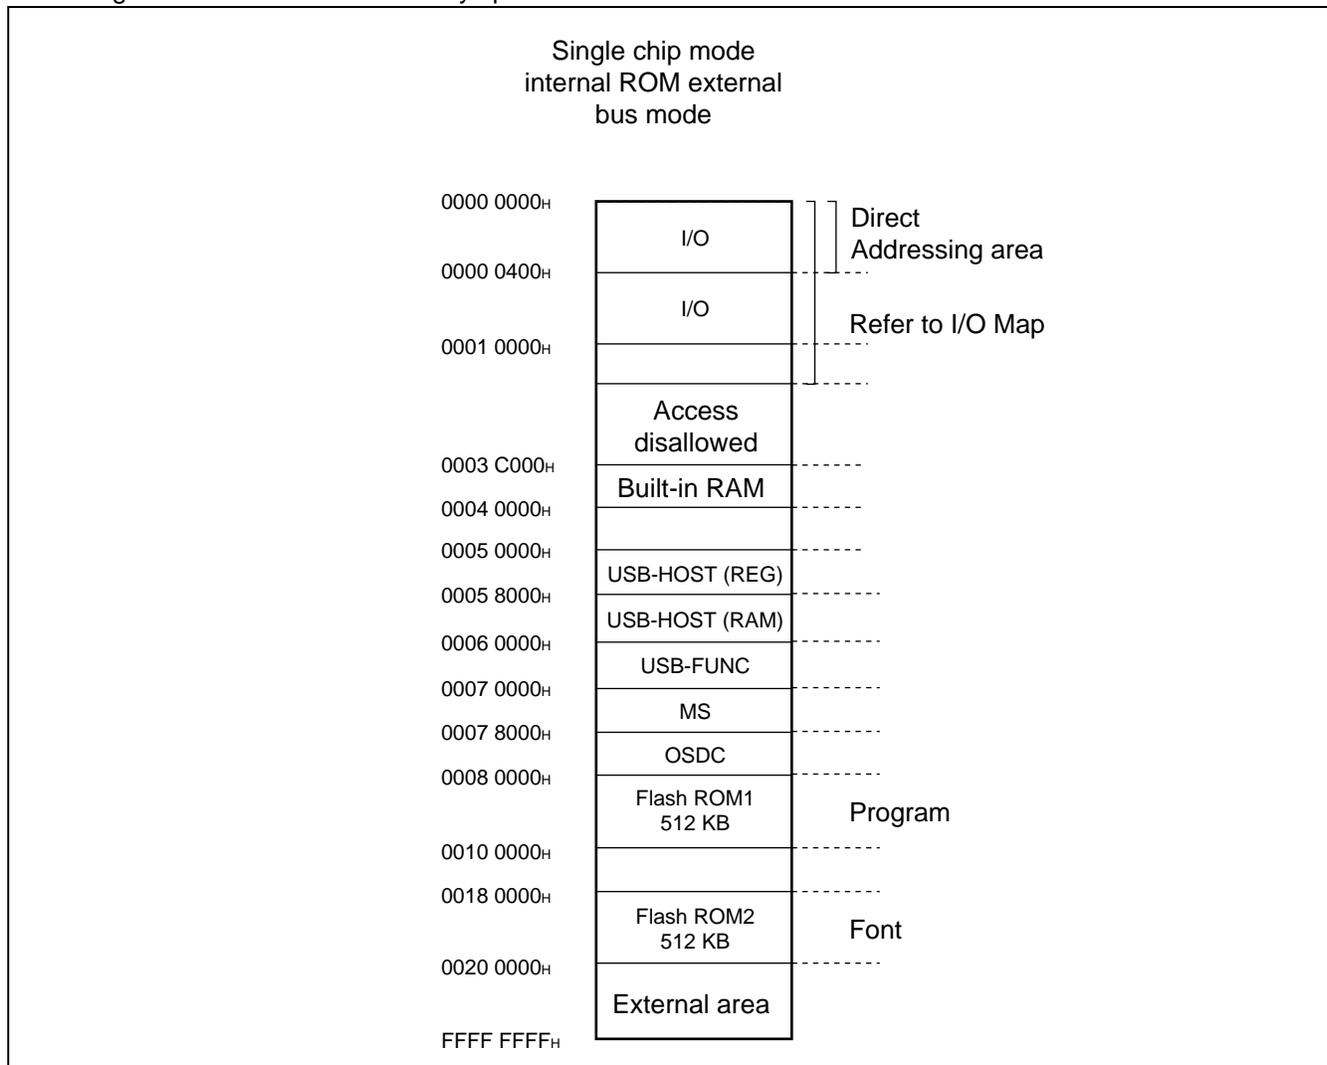

These areas are called direct addressing areas, in which the address of an operand can be specified directly during an instruction.

The size of directly addressable areas depends on the length of the data being accessed as shown below.

- byte data access : 0-0FF<sub>H</sub>
- half word data access : 0-1FF<sub>H</sub>
- word data access : 0-3FF<sub>H</sub>

### 2. Memory Map

The figure below shows the memory space of the this item kind.

# MB91310 Series

## ■ I/O MAP

This shows the location of the various peripheral resource registers in the memory space.

[How to read the table]

Address	Register				Block
	+ 0	+ 1	+ 2	+ 3	
000000H	PDR0 [R/W] XXXXXXXX	PDR1 [R/W] XXXXXXXX	PDR2 [R/W] XXXXXXXX	PDR3 [R/W] XXXXXXXX	T-unit Port Data Register

Read/Write attribute

Initial value after a reset

Register name (First-column register at address 4n; second-column register at address 4n + 2)

Location of left - most register (When using word access, the register in column 1 is in the MSB side of the data.)

Note:Initial values of register bits are represented as follows:

- "1" : Initial Value: "1"
- "0" : Initial Value: "0"
- "X" : Initial Value: "X"
- "-" : No physical register at this location

## ■ ELECTRICAL CHARACTERISTICS

### 1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage	V <sub>DDE</sub> (3.3 V)	V <sub>SS</sub> – 0.5	V <sub>SS</sub> + 4.0	V	
	V <sub>DDI</sub> (2.5 V)	V <sub>SS</sub> – 0.5	V <sub>SS</sub> + 3.0	V	
Analog power supply voltage	A <sub>VCC</sub>	V <sub>SS</sub> – 0.5	V <sub>SS</sub> + 4.0	V	
Input voltage	V <sub>I</sub>	V <sub>SS</sub> – 0.5	V <sub>CC</sub> + 0.5	V	
Analog pin input voltage	V <sub>IA</sub>	V <sub>SS</sub> – 0.5	A <sub>VCC</sub> + 0.5	V	
Output voltage	V <sub>O</sub>	V <sub>SS</sub> – 0.5	V <sub>CC</sub> + 0.5	V	
Storage temperature	T <sub>stg</sub>	– 40	+ 125	°C	

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

### 2. Recommended Operating Conditions

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Operating temperature	T <sub>a</sub>	– 10	+ 70	°C	
Power supply voltage	V <sub>DDE</sub> (3.3 V)	3.00	3.6	V	
	V <sub>DDI</sub> (2.5 V)	2.30	2.70		
Analog power supply voltage	A <sub>VCC</sub>	3.00	3.60	V	

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

## 4. USB

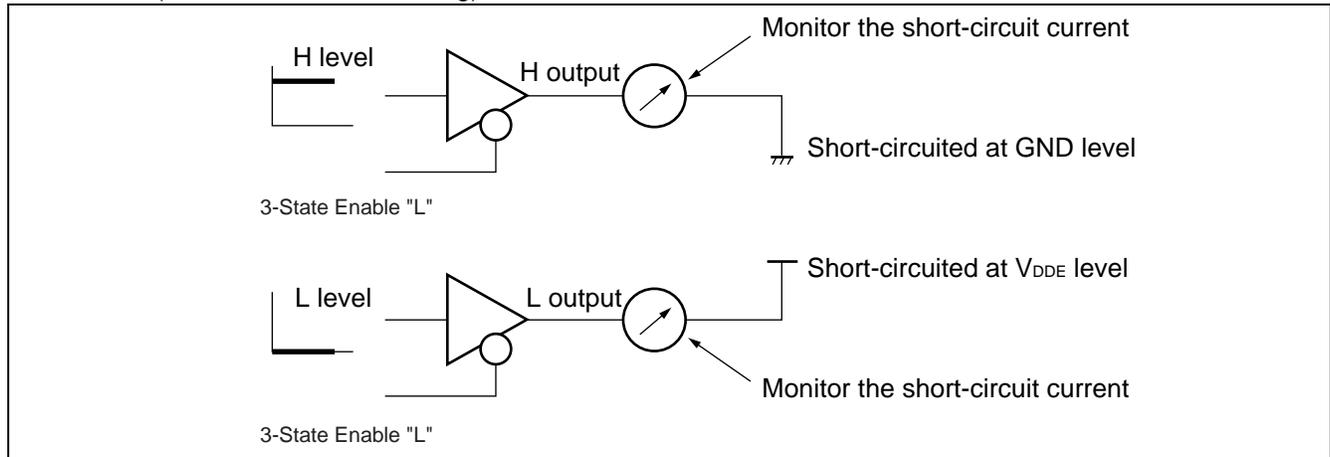

### (1) DC Characteristics

( $T_a = -10\text{ }^{\circ}\text{C}$  to  $+70\text{ }^{\circ}\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

Parameter	Symbol	Pin	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
H level output voltage	$V_{OH}$	—	$I_{OH} = -100\text{ }\mu\text{A}$	$V_{DDE} - 0.2$	—	$V_{DDE}$	V	
Output Level Voltage	$V_{OL}$	—	$I_{OL} = 100\text{ }\mu\text{A}$	0	—	0.2	V	
H level output current	$I_{OH}$	—	Full Speed $V_{OH} = V_{DDE} - 0.4\text{ V}$	-20	—	—	mA	
			Low Speed $V_{OH} = V_{DDE} - 0.4\text{ V}$	-6	—	—		
L level output current	$I_{OL}$	—	Full Speed $V_{OL} = 0.4\text{ V}$	20	—	—	mA	
			Low Speed $V_{OL} = 0.4\text{ V}$	6	—	—		
output short circuit current	$I_{OS}$	—	—	—	—	300	mA	*1
Input leak current	$I_{LZ}$	—	—	—	—	$\pm 5$	$\mu\text{A}$	*2

\*1 : About the output short-circuit current  $I_{OS}$

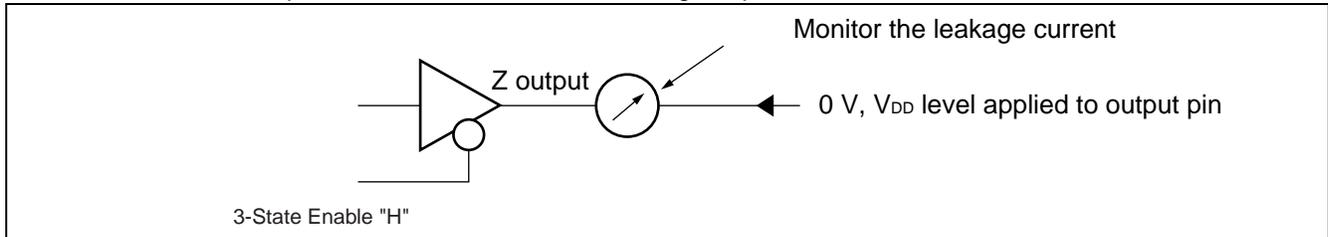

The output short-circuit current  $I_{OS}$  is the maximum current that flows when the output pin is connected to  $V_{DDE}$  or  $V_{SS}$  (within the maximum rating).

About the output short-circuit current: This is the short-circuit current per differential output pin on one side. As this USB I/O buffer is a differential output, consider both of the two pins.

\*2 : About Z leakage current  $I_{LZ}$  measurement

The input leakage current  $I_{LZ}$  indicates the leakage current that flows when the  $V_{DDE}$  or  $V_{SS}$  voltage is applied to the bidirectional pin with the USB I/O buffer in a high impedance state.

# MB91310 Series

## (2) DC characteristics

Conforming to the USB Specification Revision 1.1.

( $T_a = -10\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
"H" level input voltage (driven)	$V_{IH}$	2.0	—	V	*1
"L" level input voltage	$V_{IL}$	—	0.8	V	*1
Differential Input Sensitivity	$V_{DI}$	0.2	—	V	*2
Differential Common Mode Range	$V_{CM}$	0.8	2.5	V	*2
"H" level output voltage (driven)	$V_{OH}$	2.8	3.6	V	*3
"L" level output voltage	$V_{OL}$	0.0	0.3	V	*3
External Output Signal Crossover Voltage	$V_{CRS}$	1.3	2.0	V	*4
Bus Pull-Up Resistor on Upstream Port	RPU	1.425	1.575	k $\Omega$	1.5 k $\Omega$ $\pm$ 5%
Bus Pull-Down Resistor on Downstream Port	RPD	1.425	1.575	k $\Omega$	1.5 k $\Omega$ $\pm$ 5%
Termination voltage for upstream port pull-up	$V_{TERM}$	3.0	3.6	V	*5

\*1 : About input voltages  $V_{IH}$  and  $V_{IL}$

The Single-End-Receiver switching threshold voltage of the USB I/O buffer is set within the range of  $V_{IL}$  (Max) = 0.8 V and  $V_{IH}$  (Min) = 2.0 V (TTL input standard).

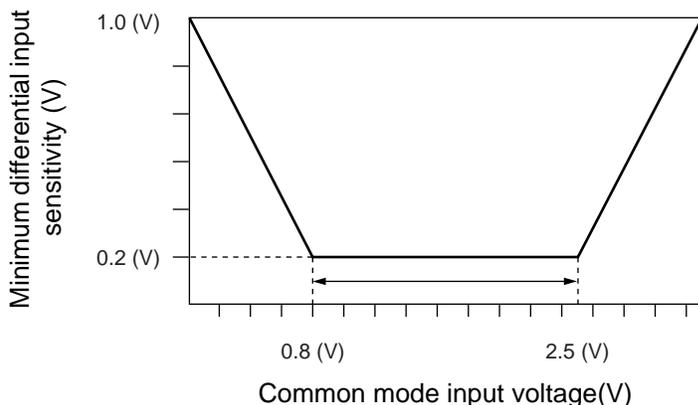

Appropriate hysteresis is provided to reduce noise sensitivity.

\*2 : About input voltages  $V_{DI}$  and  $V_{CM}$

The Differential-Receiver is used to receive USB differential data signals.

The Differential-Receiver has a differential input sensitivity of 200 mV when the differential data input remains in the range of 0.8 to 2.5 V to the local ground reference level.

The above voltage range is referred to as the common mode input voltage range.

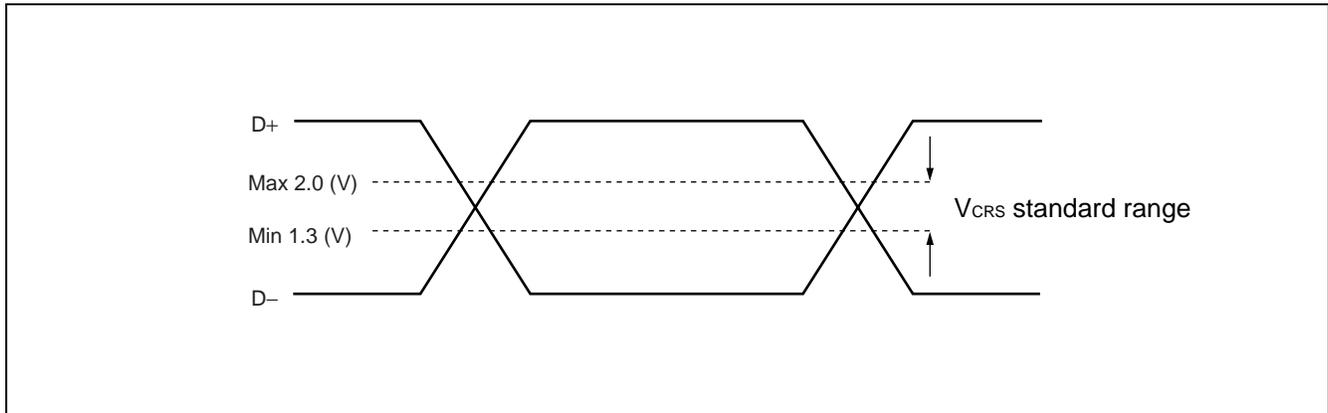

**\*3 : About output voltages  $V_{OL}$  and  $V_{OH}$**

The output drive capabilities of the driver are 0.3 V or less in Low-State ( $V_{OL}$ ) (when 1.5 k $\Omega$  is loaded at 3.6 V) and 2.8 V or more in High-State ( $V_{OH}$ ) (when 15 k $\Omega$  is loaded at the ground).

**\*4 : About output voltages  $V_{CRS}$**

The cross voltage of the external differential output signal (D+/D-) of the USB I/O buffer ranges from 1.3 V to 2.0 V.

**\*5 : About termination  $V_{TERM}$**

$V_{TERM}$  represents the pull-up voltage at the upstream port.

# MB91310 Series

## 5. AC Characteristics

### (1) Clock Timing

( $T_a = -10\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

Parameter	Symbol	Pin	Condi-tions	Value			Unit	Remarks
				Min	Typ	Max		
Clock frequency	fc	X0, X1	—	—	10.135	—	MHz	PLL system (Operation at a maximum internal speed of 40.54 MHz by quadrupling a self-oscillation frequency of 10.135 MHz via PLL)
Internal operating clock frequency	fc <sub>p</sub>	—	—	2.53	—	40.54	MHz	CPU
	fc <sub>pp</sub>	—	—	2.53	—	20.27	MHz	Peripheral

### (2) Reset

( $T_a = -10\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

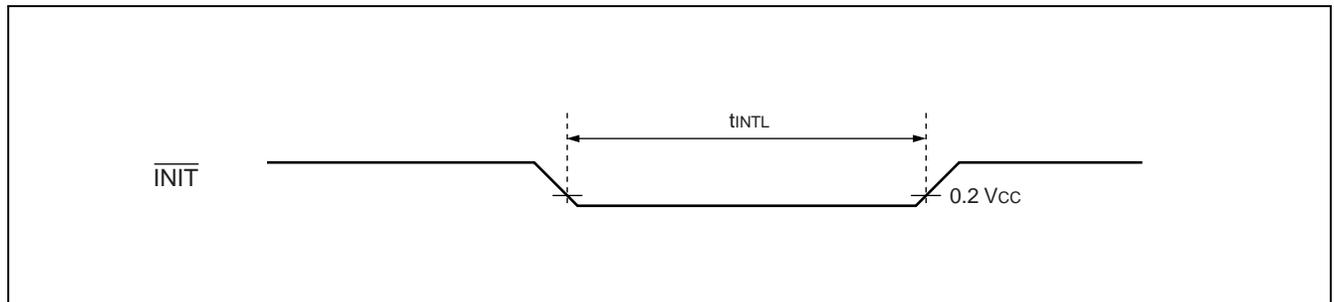

Parameter	Symbol	Pin	Condi-tions	Value		Unit	Remarks
				Min	Max		
INIT input time (at power-on)	t <sub>INTL</sub>	$\overline{\text{INIT}}$	—	*	—	ns	
INIT input time (other than at power - on)				t <sub>CP</sub> × 5	—	ns	
INIT input time (stop recovery time)				*	—	ns	

\* : INIT input time (at power-on)

FAR, CERLOCK :  $\phi \times 2^{15}$  or greater recommended

Crystal :  $\phi \times 2^{21}$  or greater recommended

$\phi$  : Power on → X0/X1 period × 2

## (3) UART timing

( $T_a = -10\text{ }^{\circ}\text{C}$  to  $+70\text{ }^{\circ}\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

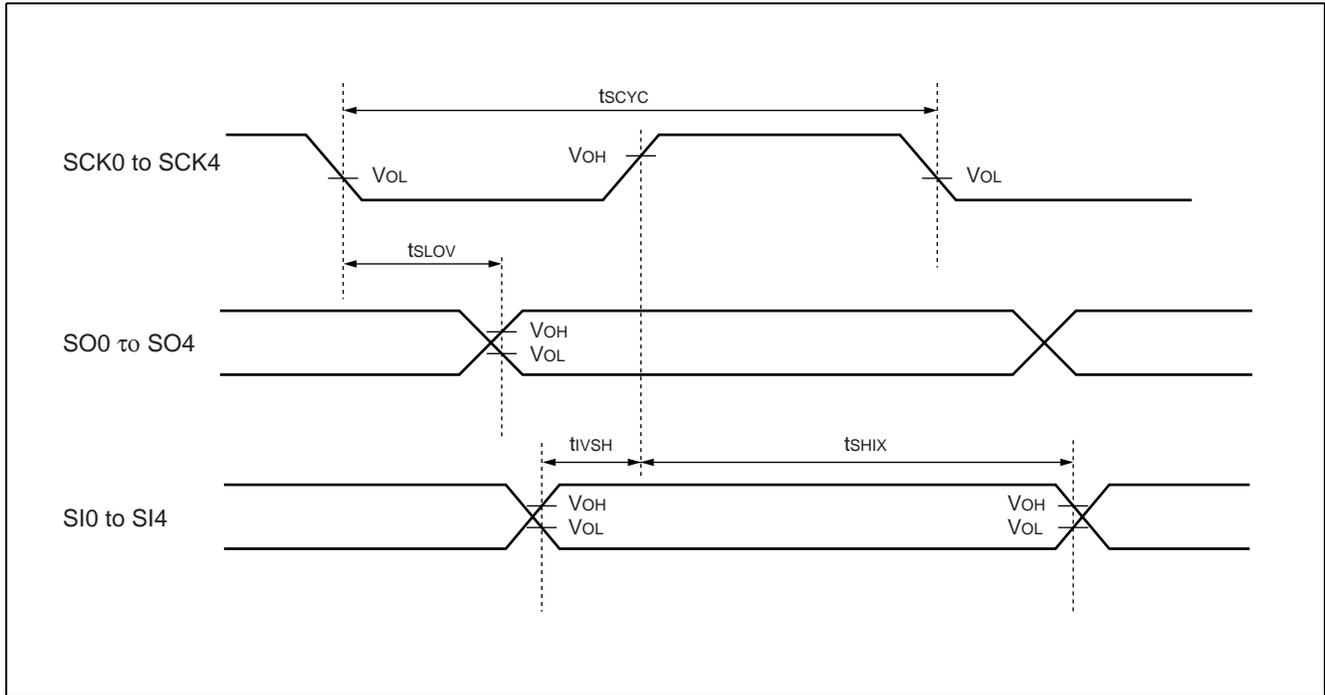

Parameter	Symbol	Pin	Conditions	Value		Unit	Remarks
				Min	Max		
Serial clock cycle time	$t_{SCYC}$	SCK0 to SCK4	internal shift lock mode	$8 t_{CYCP}^*$	—	ns	
SCK↓ → SO delay time	$t_{SLOV}$	SCK0 to SCK4 SO0 to SO4		- 80	+ 80	ns	
Valid SI → SCK↑	$t_{IVSH}$	SCK0 to SCK4 SI0 to SI4		100	—	ns

		UHP/UHM	Low Speed	75	—	300	ns	*2
Fall Time	tf	UHP/UHM UDP/UDM	Full Speed	4	—	20	ns	*2
		UHP/UHM	Low Speed	75	—	300	ns	*2
Differential Rise and Fall Timing Matching	Tfrfm	UHP/UHM UDP/UDM	Full Speed	90	—	111.11	%	*2
		UHP/UHM	Low Speed	80	—	125	%	*2
Driver Output Resistance	Rzdrv	UDP UDM	—	28	—	44	$\Omega$	*3

\*1 : The AC characteristics of the USB interface conform to the USB Specification Revision 1.1.

\*2 : About driver characteristics tr, tf, and Tfrfm

These represent the rise (tr) and fall (tf) time standards of the differential data signal.

These are defined as times between 10% and 90% of the output signal voltage.

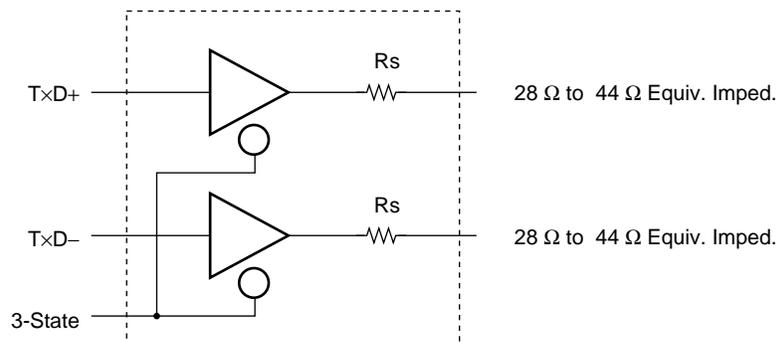

For full-speed buffer, the tr/tf ratio is specified to fall within  $\pm 10\%$  to minimize RFI radiation.

\*3 : About driver characteristic ZDRV

USB full-speed connection is made by the twisted pair cable shielded at a characteristic impedance ( $Z_0$ ) of  $90 \Omega \pm 15\%$ . The USB Specification stipulates that the USB driver output impedance be within the range of  $28 \Omega$  to  $44 \Omega$ . The USB Specification also stipulates that a discrete serial resistor ( $R_s$ ) be added for balancing purposes while satisfying the above standards.

The output impedance of the USB I/O buffer in this LSI is about  $3 \Omega$  to  $19 \Omega$ .

As the serial resistor  $R_s$ , therefore, a  $25 \Omega$  to  $30 \Omega$  type ( $27 \Omega$  type recommended) should be added.

Driver output impedance  $3 \Omega$  to  $19 \Omega$   
 $R_s$   $25 \Omega$  to  $30 \Omega$  (recommended value:  $27 \Omega$ )

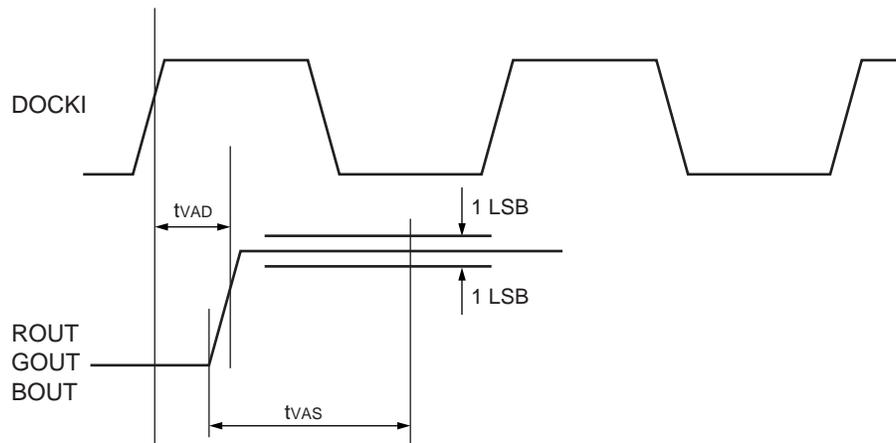

# MB91310 Series

## (7) Analog RGB

( $T_a = -10\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

Analog RGB output delay	$t_{VAD}$	ROUT, GOUT, BOUT	$V_{REF} = 1.1\text{ V}$ , $V_{DDR} = V_{DDG} = V_{DDB} = 2.5\text{ V}$ ,	—	5	—	ns	—
Analog RGB output settling time	$t_{VAS}$	ROUT, GOUT, BOUT	$V_{RO} = 2.7\text{ k}\Omega$ , $R_{COMP} = G_{COMP} = B_{COMP} = 0.1\text{ }\mu\text{F}$	—	10	—	ns	—

### • Display signal output timing

## (8) Digital RGB

Vertical sync, horizontal sync, and display output control signal input timings

( $T_a = -10\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )

Parameter	Symbol	Pin	Value		Unit	Remarks
			Min	Max		
Horizontal sync signal cycle time	$t_{HCYC}$	HSYNC	$100 + t_{WH}$	—	Dot clock	
Horizontal sync signal pulse width	$t_{WH}$	HSYNC	20	—	Dot clock	*1
			—	6	$\mu\text{s}$	
Horizontal sync signal setup time	$t_{DHST}$	HSYNC	4	—	ns	
Horizontal sync signal hold time	$t_{DHHD}$		0	—	ns	
Vertical sync signal setup time	$t_{HVST}$	VSYNC	5	$1H^{*2} - 5$	Dot clock	
Vertical sync signal hold time	$t_{HVHD}$		3	—	$H^{*2}$	
Input sync signal rise/fall time	$t_{DR}$	HSYNC	—	5	ns	
	$t_{DF}$	VSYNC				

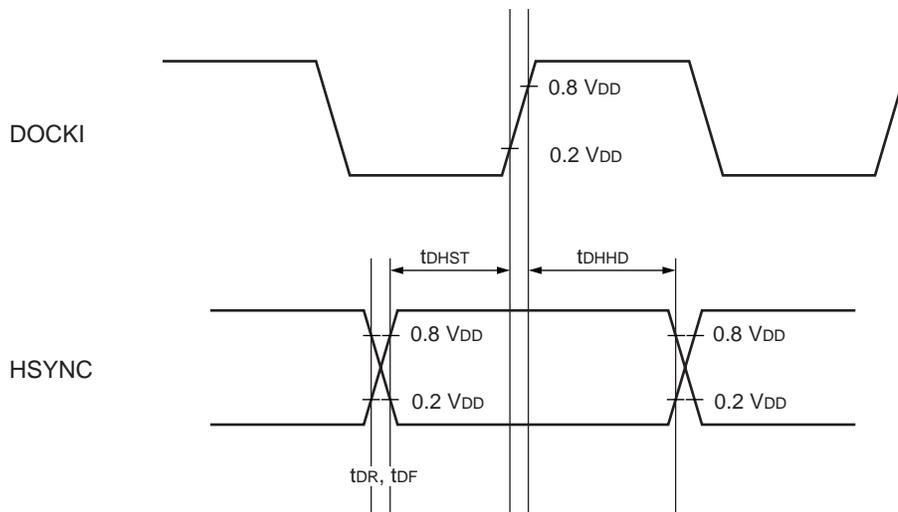

\*1 : During the horizontal sync signal pulse period, the device stops its internal OSDC operation, disabling writing to the internal VRAM. Therefore, set the horizontal sync signal pulse width and VRAM write cycle to ensure that: horizontal sync signal pulse width < VRAM write cycle.

Precisely, adjust the command issuance interval not to issue command 2 or command 4 (VRAM write command) more than once in the horizontal sync signal pulse with period.

If the above condition is not satisfied, the device may fail writing to VRAM.

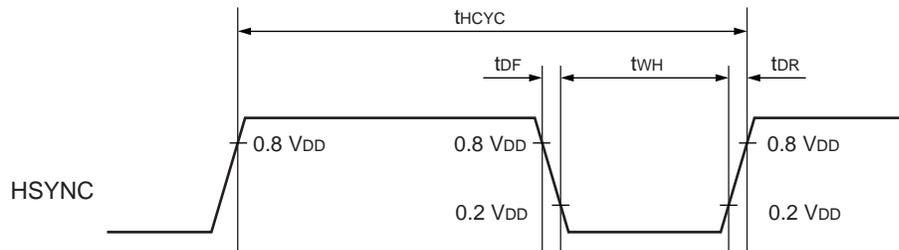

\*2 : 1H is assumed to be one horizontal sync signal period.

## 6. 0.25 μm Technology About the Power-on Sequence for Dual-power-supply Models

- The power supplies must be turned on in the VDDI→AVCC, AVRH→VDDE order and off in the VDDE→AVCC, AVRH→VDDI order.  
When VDDI is turned on earlier, the potential difference between VDDI and VDDE must be within 3.6 V.
- Turn on VDDE before turning on analog power supply AVCC and applying the analog signal.

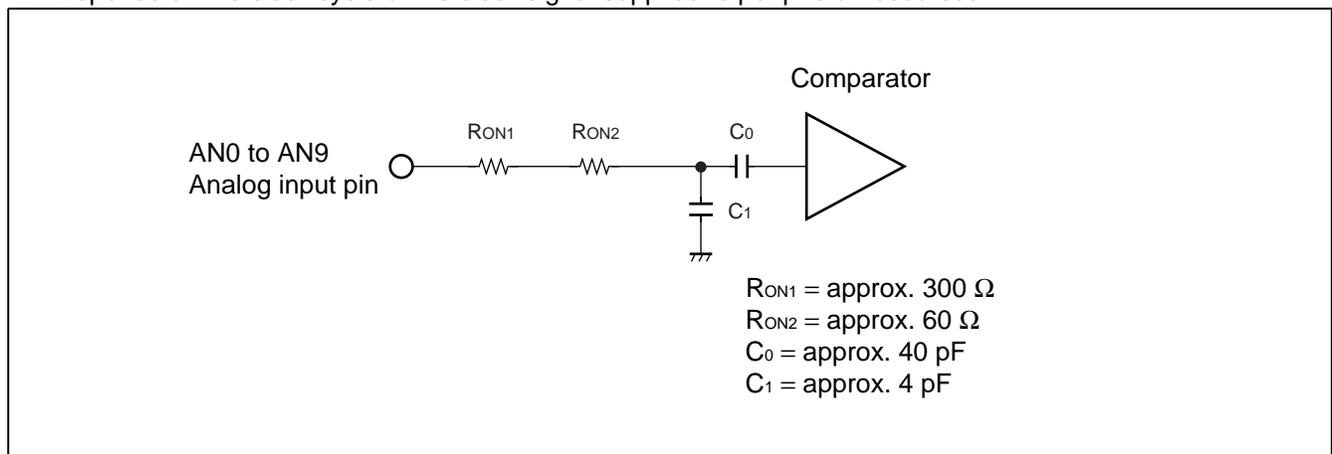

## 7. Electrical Characteristics for the A/D Converter

( $T_a = -10\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ ,  $V_{DDE} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{DDI} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $AV_{RH} = 3.0\text{ V}$  to  $3.6\text{ V}$ )

## FUJITSU LIMITED

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of Fujitsu semiconductor device; Fujitsu does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information. Fujitsu assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of Fujitsu or any third party or does Fujitsu warrant non-infringement of any third-party's intellectual property right or other right by using such information. Fujitsu assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
