N08L163WC2A

8Mb Ultra-Low Power Asynchronous CMOS SRAM

512K × 16 bit

Overview

The N08L163WC2A is an integrated memory device containing a 8 Mbit Static Random Access Memory organized as 524,288 words by 16 bits. The device is designed and fabricated using NanoAmp's advanced CMOS technology to provide both high-speed performance and ultra-low power. The device operates with two chip enable ($\overline{CE1}$ and CE2) controls and output enable ($\overline{OE}$) to allow for easy memory expansion. 1. When $\overline{UB}$ and $\overline{LB}$ are in select mode (low), I/O_0 - I/O_{15} are affected as shown. When $\overline{LB}$ only is in the select mode only I/O_0 - I/O_7 are affected as shown. When $\overline{UB}$ is in the select mode only I/O_8 - I/O_{15} are affected as shown.

2. When the device is in standby mode, control inputs ($\overline{WE}$, $\overline{OE}$, $\overline{UB}$, and $\overline{LB}$), address inputs and data input/outputs are internally isolated from any external influence and disabled from exerting any influence externally.

3. When $\overline{WE}$ is invoked, the $\overline{OE}$ input is internally disabled and has no effect on the circuit.

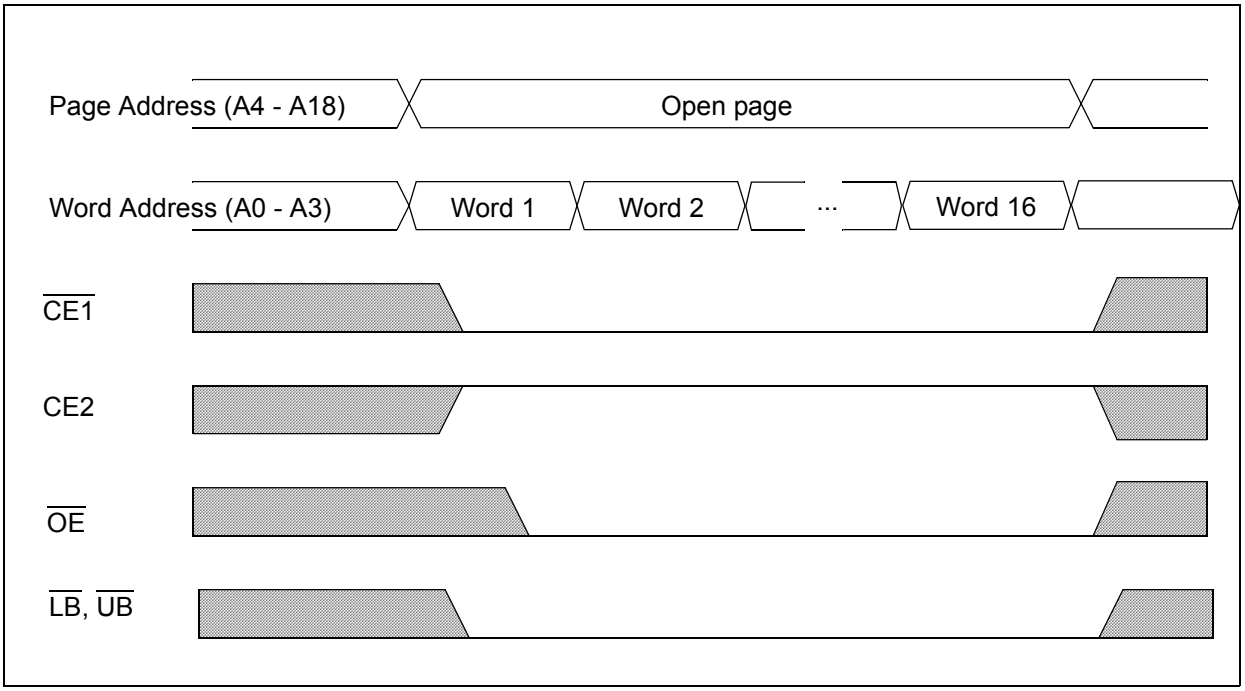
1. Typical values are measured at Vcc=Vcc Typ., T_A=25°C and not 100% tested.

2. This parameter is specified with the outputs disabled to avoid external loading effects. The user must add current required to drive output capacitance expected in the actual system.

3. This device assumes a standby mode if the chip is disabled ($\overline{CE1}$ high or CE2 low). In order to achieve low standby current all inputs must be within 0.2 volts of either VCC or VSS.

Power Savings with Page Mode Operation ($\overline{WE}$ = V_{IH})



Note: Page mode operation is a method of addressing the SRAM to save operating current. The internal organization of the SRAM is optimized to allow this unique operating mode to be used as a valuable power saving feature.

The only thing that needs to be done is to address the SRAM in a manner that the internal page is left open and 16-bit words of data are read from the open page. By treating addresses A0-A3 as the least significant bits and addressing the 16 words within the open page, power is reduced to the page mode value which is considerably lower than standard operating currents for low power SRAMs.
