

NT256S72V89A0G

256MB : 32M x 72

Unbuffered SDRAM Module

32Mx72 bit One Bank Unbuffered SDRAM Module
based on 32Mx8, 4Banks, 8K Refresh, 3.3V Synchronous DRAMs with SPD

Features

- 168-Pin Unbuffered 8-Byte Dual In-Line Memory Module
- Intended for PC133 applications
 - Clock Frequency: 133MHz
 - Clock Cycle: 7.5ns
 - Clock Access Time: 5.4ns
- Inputs and outputs are LVTTTL (3.3V) compatible
- Single 3.3V $\pm$ 0.3V Power Supply
- Single Pulsed RAS interface
- SDRAMs have 4 internal banks
- Module has 1 physical bank
- Fully Synchronous to positive Clock Edge
- Data Mask for Byte Read/Write control
- Auto Refresh (CBR) and Self Refresh
- Automatic and controlled Precharge commands
- Programmable Operation:
 - CAS Latency: 2, 3
 - Burst Type: Sequential or Interleave
 - Burst Length: 1, 2, 4, 8
 - Operation: Burst Read and Write or Multiple Burst Read with Single Write
- Suspend Mode and Power Down Mode
- 8192 Refresh cycles distributed across 64ms
- Gold contacts
- SDRAMs in TSOP Type II Package
- Serial Presence Detect with Write Protect

Description

NT256S72V89A0G is unbuffered 168-pin Synchronous DRAM Dual In-Line Memory Modules (DIMM) which is organized as 32Mx72 high-speed memory arrays and is configured as one 32M x 72 physical bank. The DIMM uses nine 32Mx8 SDRAMs in 400mil TSOP II packages. The DIMM achieves high-speed data transfer rates of up to 133MHz by employing a prefetch / pipeline hybrid architecture that supports the JEDEC 1N rule while allowing very low burst power.

All control, address, and data input/output circuits are synchronized with the positive edge of the externally supplied clock inputs. All inputs are sampled at the positive edge of each externally supplied clock (CK0, CK2). Internal operating modes are defined by combinations of $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$, $\overline{\text{S0}} / \overline{\text{S2}}$, DQMB, and CKE0 signals. A command decoder initiates the necessary timings for each operation. A 15-bit address bus accepts address information in a row / column multiplexing arrangement.

Prior to any Access operation, the $\overline{\text{CAS}}$ latency, burst type, burst length, and Burst operation type must be programmed into the DIMM by address inputs A0-A9 during the Mode Register Set cycle. The DIMM uses serial presence detects implemented via a serial EEPROM using the two-pin IIC protocol. The first 128 bytes of serial PD data are used by the DIMM manufacturer. The last 128 bytes are available to the customer.

Note: All pin assignments are consistent for all 8-byte unbuffered versions. Check bits (CB0-CB7) are applicable only to the x72 DIMM;

*CK1 and CK3 are terminated .

SDRAM DIMM Block Diagram (1 Bank, 32Mx8 SDRAMs)

Input/Output Functional Description

Symbol	Type	Signal	Polarity	Function
CK0 , CK2	Input	Pulse	Positive Edge	The system clock inputs. All of the SDRAM inputs are sampled on the rising edge of their associated clock.
CKE0	Input	Level	Active High	Activates the SDRAM CK0 and CK2 signals when high and deactivates them when low. By deactivating the clocks, CKE0 low initiates the Power Down mode, Suspend mode, or the Self-Refresh mode.
$\overline{S0}$, $\overline{S2}$	Input	Pulse	Active Low	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue.
$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	Input	Pulse	Active Low	When sampled at the positive rising edge of the clock, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$ define the operation to be executed by the SDRAM.
BA0, BA1	Input	Level	-	Selects which SDRAM bank is to be active.
A0 - A9 A10/AP A11, A12	Input	Level	-	During a Bank Activate command cycle, A0-A12 defines the row address (RA0-RA12) when sampled at the rising clock edge. During a Read or Write command cycle, A0-A9 defines the column address (CA0-CA9) when sampled at the rising clock edge. In addition to the column address, AP is used to invoke Autoprecharge operation at the end of the Burst Read or Write cycle. If AP is high, autoprecharge is selected and BA0/BA1 define the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0/BA1 to control which bank(s) to precharge. If AP is high all 4 banks will be precharged regardless of the state of BA0/BA1. If AP is low, then BA0/BA1 are used to define which bank to pre-charge.
DQ0 - DQ63, CB0 - CB7	Input /Output	Level	-	Data and Check Bit input/output pins operate in the same manner as on conventional DRAMs.
DQMB0 -DQMB7	Input	Pulse	Active High	The Data input/output mask places the DQ buffers in a high impedance state when sampled high. In Read mode, DQM has a latency of two clock cycles and controls the output buffers like an output enable. In Write mode, DQM has a latency of zero and operates as a byte mask by allowing input data to be written if it is low but blocks the Write operation if DQM is high.
SA0 – SA2	Input	Level	-	Address inputs. Connected to either VDD or VSS on the system board to configure the Serial Presence Detect EEPROM address.
SDA	Input /Output	Level	-	Serial Data. Bi-directional signal used to transfer data into and out of the Serial Presence Detect EEPROM. Since the SDA signal is Open Drain/Open Collector at the EEPROM, a pull-up resistor is required on the system board.
SCL	Input	Pulse	-	Serial Clock. Used to clock all Serial Presence Detect data into and out of the EEPROM. Since the SCL signal is inactive in the “high” state, a pull-up resistor is recommended on the system board.
WP	Input	Level	Active High	Hardware Write Protect. When WP is active, writing to the EEPROM array is inhibited. On the DIMM, this input is connected to the EEPROM Write Protect input and is also tied to ground through a 47K ohm pull-down resistor.
VDD , VSS	Supply			Power and ground for the module.

Symbol	Parameter	Rating	Units	Notes

1. These parameters depend on the cycle rate and are measured with the cycle determined by the minimum value of t_{CK} and t_{RC} . Input signals are changed up to three times during $t_{RC}(\text{min})$.
2. The specified values are obtained with the output open.
3. Input signals are changed once during three clock cycles.
4. Input signals are stable.
5. Active standby current will be higher if Clock Suspend is entered during a Burst Read cycle (add 1mA per DQ).
6. Input signals are changed once during $t_{CK}(\text{min})$.
7. $V_{DD} = 3.3\text{V}$
8. Input pulse levels $V_{DD} \times 0.1$ to $V_{DD} \times 0.9$, input rise and fall times 10ns, input and output timing levels $V_{DD} \times 0.5$, output load 1 TTL gate and $CL=100\text{pF}$.

AC Characteristics (TA = 0 to 70 °C , VDD = 3.3 ± 0.3V)

1. An initial pause of 200us, with DQMB0-7 and CKE0 held high, is required after power-up. A Precharge All Banks command must be given followed by a minimum of eight Auto (CBR) Refresh cycles before or after the Mode Register Set operation.
2. The Transition time is measured between VIH and VIL (or between VIH and VIL).
3. In addition to meeting the transition rate specification, the CK0, CK2, and CKE0 signals must transit between VIH and VIL (or between VIL and VIH) in a monotonic manner.
4. AC timing tests have VIL = 0.8V and VIH = 2.0 V with the timing referenced to the 1.40V crossover point.
5. AC measurements assume tT = 1.2 ns.

AC Output Load Circuits

AC Timing Parameters

Clock and Clock Enable Parameters

Symbol	Parameter	- 7K		- 75B		- 8B		Unit	Note
		Min.	Max.	Min.	Max.	Min.	Max.		
tCK3	Clock Cycle Time, $\overline{\text{CAS}}$ Latency = 3	7	1000	7.5	1000	8	1000	ns	
tCK2	Clock Cycle Time, $\overline{\text{CAS}}$ Latency = 2	7.5	1000	10	1000	10	1000	ns	
tAC3(B)	Clock Access Time, $\overline{\text{CAS}}$ Latency = 3	-	5.4	-	5.4	-	6	ns	1
tAC2(B)	Clock Access Time, $\overline{\text{CAS}}$ Latency = 2	-	5.4	-	6	-	6	ns	1
tCKH	Clock High Pulse Width	2.5	-	2.5	-	3	-	ns	2
tCKL	Clock Low Pulse Width	2.5	-	2.5	-	3	-	ns	2
tCES	Clock Enable Set-up Time	1.5	-	1.5	-	2	-	ns	
tCEH	Clock Enable Hold Time	0.8	-	0.8	-	1	-	ns	
tSB	Power down mode Entry Time	0	7.5	0	7.5	0	12	ns	
tT	Transition Time (Rise and Fall)	0.5	10	0.5	10	0.5	10	ns	

1. Access time is measured at 1.4V. In AC Characteristics section, see notes.
2. t_{CKH} is the pulse width of CLK measured from the positive edge to the negative edge referenced to V_{IH} (min). t_{CKL} is the pulse width of CLK measured from the negative edge to the positive edge referenced to V_{IL} (max).

Common Parameters

Symbol	Parameter	- 7K		- 75B		- 8B		Unit	Note

Unbuffered SDRAM Module

Serial Presence Detect -- Part 2 of 2

32Mx72 SDRAM DIMM based on 32Mx8, 4Banks, 8K Refresh, 3.3V SDRAMs with SPD

Byte	Description	SPD Entry Value			Serial PD Data Entry (Hexadecimal)			Note
		-7K	-75B	-8B	-7K	-75B	-8B	
64-71	Manufacturer's JEDED ID Code	NANYA			7F7F7F0B00000000			3
72	Module Manufacturing Location	N/A			00			
73-90	Module Part number	N/A	N/A	N/A	00	00	00	
91-92	Module Revision Code	N/A			00			
93-94	Module Manufacturing Data	Year/Week Code			yy/ww			1,2
95-98	Module Serial Number	Serial Number			00			
99-125	Reserved	Undefined			00			
126	Modules Supports this Clock Frequency	100MHz			64			
127	Attributes for Clock Frequency defined in byte 126	CK0, CK2,CL3, CL2 Concurrent AP			AF			
128-255	Open for customer Use	Undefined			00			

1. yy= Binary coded decimal year code, 0-99(Decimal), 00-63(Hex)
2. ww= Binary coded decimal year code, 01-52(Decimal), 01-34(Hex)
3. NANYA 11decimal (bank four) 0000 1011 binary 0B Hex.
