

**Features**

- Low On-resistance: 60Ω typ, with ±5V Supplies, Minimizes Distortion
- On-Resistance Matching between channels better than 6Ω
- Guaranteed Low Leakage Currents: <0.1nA at +25°C
- Rail-to-Rail Analog Signal Range
- Low Distortion: <0.04% (600Ω)
- Low Crosstalk: -90dB @100kHz
- TTL/CMOS Compatible (with +5V or ±5V Supplies)
- Low Power Consumption.
- 16-pin Narrow SOIC and QSOP Packages save board area
- Pin-compatible upgrades for 74HC4051/4052/4053

**Applications**

- Audio and Video Switching and Routing
- Lab and Medical Instrumentation
- Low-Voltage Data-Acquisition and Process Control Systems
- Battery-Powered Communication Systems

**Description**

The PS4051/PS4052/PS4053 are precision low-voltage CMOS analog multiplexers/switches.

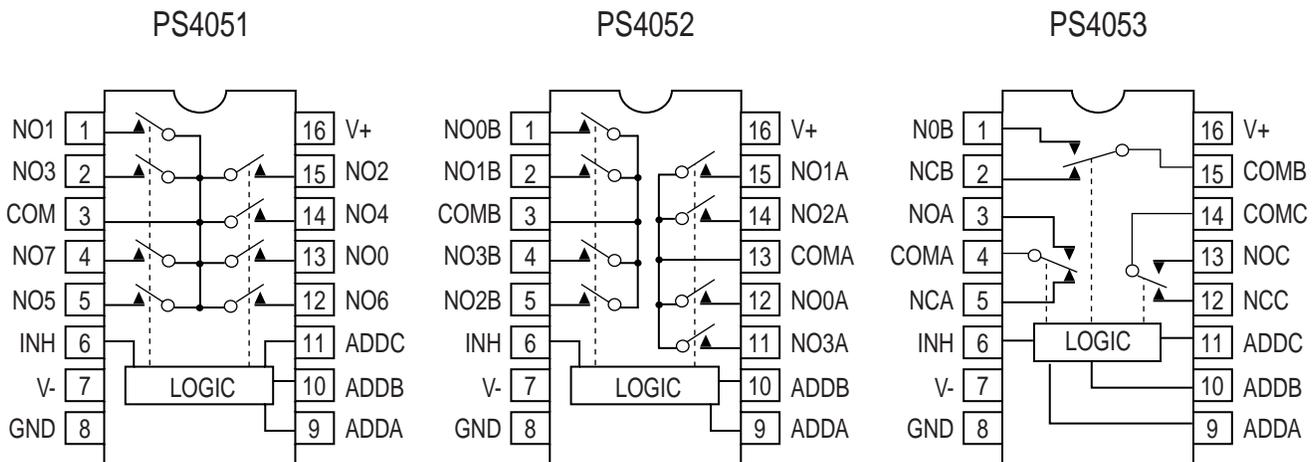

The PS4051 is an eight-channel single-ended mux designed to select one of eight inputs to a common output. What input is selected depends on the status of three address bits (ADDA-ADDC). The PS4052 is a differential four-channel mux, controlled by two address bits: ADDA, and ADDB. The PS4053 is a triple 2-to-1 mux (or triple SPDT, single-pole double-throw, switch).

The INH (inhibit) pin can be driven high, to open all switches regardless of address bit status. All control inputs are TTL compatible when V+ = +5V.

These devices are designed to operate with power supplies from ±2.7V to ±8V. Single-supply operation is possible from +2.7V to +16V.

When on, each switch conducts current equally well in either direction and can handle rail-to-rail analog signals. In the off-state each switch blocks voltages up to the power-supply rails. Off-leakage current is guaranteed to be less than 0.1nA at +25°C, and <2.5nA at +85°C.

These devices are available in 16-pin DIP, Narrow SOIC, and QSOP packages for operation over the -40°C to +85°C temperature range.

 Logic "1",  $V_{IH} \geq 2.4V$

### Absolute Maximum Ratings

Voltages Referenced to V-

V+	-0.3V to +17V
GND	-0.3V to +17V
GND	-0.3V to (V+) + 0.3V
$V_{IN}, V_{COM}, V_{NO}^{(1)}$	(V-) -2V to (V+) + 2V or 30mA, whichever occurs first
Current (any terminal)	30mA
Peak Current, COM, NO, NC (pulsed at 1ms, 10% duty cycle)	100mA
ESD per method 3015.7	>2000V

### Thermal Information

Continuous Power Dissipation

Plastic DIP (derate 10.5mW/°C above +70°C)	800mW
Narrow SO and QSOP (derate 8.7mW/°C above +70°C)	650mW
Storage Temperature	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C

#### Note 1:

Signals on NO, COM, or logic inputs exceeding V+ or V- are clamped by internal diodes. Limit forward diode current to 30mA.

**Caution:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied.

Negative Supply Current	I-				-10		

**Notes:**

- The algebraic convention, where most negative value is a minimum and most positive is a maximum, is used in this data sheet.
- Typical values are for DESIGN AID ONLY, not guaranteed or subject to production testing.
- Guaranteed by design
- $\Delta R_{ON} = R_{ON \max} - R_{ON \min}$
- Flatness is defined as the difference between the maximum and minimum values of on-resistance measured over the specific analog signal range, i.e.,  $V_{NO} = 3V$  to  $0V$  and  $0V$  to  $-3V$ .
- Leakage parameters are 100% tested at maximum rated hot temperature and guaranteed by correlation at  $+25^\circ C$ .
- Off Isolation =  $20 \log_{10} V_{COM} / V_{NO}$ . See Figure 5.

**Notes:**

1. The algebraic convention, where the most negative value is a minimum and the most positive is a maximum, is used in this data sheet.
2. Typical values are for DESIGN AID ONLY, not guaranteed or subject to production testing.
3. Guaranteed by design
4. ΔR<sub>ON</sub> = R<sub>ON</sub> max - R<sub>ON</sub> min
5. Flatness is defined as the difference between the maximum and minimum value of on-resistance measured.
6. Leakage parameters are 100% tested at maximum rated hot temperature and guaranteed by correlation at +25°C.
7. Worst-case isolation is on channel 4 because of its proximity to the COM pin. Off isolation = 20log V<sub>COM</sub>/V<sub>NO</sub>.  
V<sub>COM</sub> = output, V<sub>NO</sub> = input to off switch
8. Leakage testing at single supply is guaranteed by testing with dual supplies.
