## F<sup>2</sup>MC-16LX MB90860E Series

### MB90867E(S), MB90F867E(S), MB90V340E-101/102

#### ■ DESCRIPTION

MB90860E-series with Flash ROM is especially designed for automotive and other industrial applications. With the new 0.35 μm CMOS technology, Fujitsu now offers on-chip Flash ROM program memory up to 512 Kbytes.

The power supply (3 V) is supplied to the internal MCU core from an internal regulator circuit. This creates a major advantage in terms of EMI and power consumption.

The internal PLL clock frequency multiplier provides an internal 42 ns instruction cycle time from an external 4 MHz clock.

The unit features an 8 channel Output Compare Unit and 8 channel Input Capture Unit with 2 separate 16-bit free running timers. 4 UARTs constitute additional functionality for communication purposes.

Note : F<sup>2</sup>MC is the abbreviation of FUJITSU Flexible Microcontroller.

Be sure to refer to the “Check Sheet” for the latest cautions on development.

“Check Sheet” is seen at the following support page

## ■ FEATURES

### • CPU

- Instruction system best suited to controller
- Wide choice of data types (bit, byte, word, and long word)
- Wide choice of addressing modes(23 types)
- Enhanced multiply-divide instructions and RETI instructions
- Enhanced high-precision computing with 32-bit accumulator
- Instruction system compatible with high-level language (C language) and multitask
- Employing system stack pointer
- Enhanced various pointer indirect instructions
- Barrel shift instructions
- Increased processing speed
- 4-byte instruction queue

### • Serial interface

- UART (LIN/SCI) : up to 4 channels
- Equipped with full-duplex double buffer
- Clock-asynchronous or clock-synchronous serial transmission is available
- I<sup>2</sup>C interface\* : up to 2 channels
- Up to 400 Kbits/s transfer rate

### • Interrupt controller

- Powerful interrupt function
- Powerful 8-level, 34-condition interrupt feature
- Up to 16 external interrupts are supported
- Automatic data transfer function independent of CPU
- Expanded intelligent I/O service function (EI<sup>2</sup>OS) : up to 16 channels

### • I/O port

- General-purpose input/output port (CMOS output)
  - 80 ports (devices without S-suffix)
  - 82 ports (devices with S-suffix)

### • 8/10-bit A/D converter

- 8/10-bit A/D converter : 24 channels
- Resolution is selectable between 8-bit and 10-bit.
- Activation by external trigger input is allowed.
- Conversion time : 3 μs (at 24-MHz machine clock, including sampling time)
- Program patch function

### • Timer

- Time-base timer, clock timer, watchdog timer : 1 channel
- 8/16-bit PPG timer : 8-bit × 16 channels, or 16-bit × 8 channels
- 16-bit reload timer : 4 channels
- 16-bit input/output timer
  - 16-bit free run timer : 2 channel  
(FRT0 : ICU 0/1/2/3, OCU 0/1/2/3, FRT1 : ICU 4/5/6/7, OCU 4/5/6/7)
  - 16-bit input capture: (ICU) : 8 channels
  - 16-bit output compare : (OCU) : 8 channels

- **Variety of mode**

- Low power consumption (standby) mode
- Sleep mode (a mode that halts CPU operating clock)
- Main timer mode (time-base timer mode that is transferred from main clock mode)
- PLL timer mode (time-base timer mode that is transferred from PLL clock mode)
- Watch mode (a mode that operates sub clock and clock timer only)
- Stop mode (a mode that stops oscillation clock and sub clock)
- CPU blocking operation mode

- **Technology**

- 0.35  $\mu\text{m}$  CMOS technology

- \* : I<sup>2</sup>C license :

Purchase of Fujitsu I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent Rights to use, these components in an I<sup>2</sup>C system provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.

## ■ PIN DESCRIPTION

Pin No.		Pin name	I/O Circuit type*3	Function
QFP100*1	LQFP100*2			
1 to 4	99 to 2	P24 to P27	G	General purpose I/O pins. The register can be set to select whether to use a pull-up resistor. In external bus mode, the pin is enabled as a general-purpose I/O port when the corresponding bit in the external address output control register (HACR) is 1.
		A20 to A23		Output pins of the external address bus. When the corresponding bit in the external address output control register (HACR) is 0, the pins are enabled as high address output pins (A20 to A23).
		IN0 to IN3		Trigger input pins for input captures 0 to 3.
5	3	P30	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		ALE		Address latch enable output pin. This function is enabled when the external bus is enabled.
		IN4		Trigger input pin for input capture 4.
6	4	P31	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		$\overline{RD}$		External read strobe output pin. This function is enabled when the external bus is enabled.
		IN5		Trigger input pin for input capture 5.
7	5	P32	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled either in single-chip mode or with the $\overline{WR}/\overline{WRL}$ pin output disabled.
		$\overline{WR} / \overline{WRL}$		Write strobe output pin for the external data bus. This function is enabled when both the external bus and the $\overline{WR}/\overline{WRL}$ pin output are enabled. $\overline{WRL}$ is used to write-strobe 8 lower bits of the data bus in 16-bit access while $\overline{WR}$ is used to write-strobe 8 bits of the data bus in 8-bit access.
		INT10R		External interrupt request input pin (sub) .
8	6	P33	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled either in single-chip mode or with the $\overline{WRH}$ pin output disabled.
		$\overline{WRH}$		Write strobe output pin for the 8 higher bits of the external data bus. This function is enabled when the external bus is enabled, when the external bus 16-bit mode is selected, and when the $\overline{WRH}$ output pin is enabled.

9	7	P34	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled either in single-chip mode or with the hold function disabled.
		HRQ		Hold request input pin. This function is enabled when both the external bus and the hold function are enabled.
		OUT4		Waveform output pin for output compare 4.
10	8	P35	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled either in single-chip mode or with the hold function disabled.
		$\overline{\text{HAK}}$		Hold acknowledge output pin. This function is enabled when both the external bus and the hold function are enabled.
		OUT5		Waveform output pin for output compare 5.
11	9	P36	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled either in single-chip mode or with the external ready function disabled.
		RDY		External ready input pin. This function is enabled when both the external bus and the external ready function are enabled.
		OUT6		Waveform output pin for output compare 6.
12	10	P37	G	General purpose I/O pin. The register can be set to select whether to use a pull-up resistor. This function is enabled either in single-chip mode or with the clock output disabled.
		CLK		Clock output pin. This function is enabled when both the external bus and clock output are enabled.
		OUT7		Waveform output pin for output compare 7.
13, 14	11, 12	P40, P41	F	General purpose I/O pins. (devices with S-suffix)
		X0A, X1A	B	Input pins for sub-clock (devices without S-suffix)
15	13	V <sub>CC</sub>	—	Power (3.5 V to 5.5 V) input pin
16	14	V <sub>SS</sub>	—	GND pin
17	15	C	K	This is the power supply stabilization capacitor pin. It should be connected to a higher than or equal to 0.1 $\mu\text{F}$ ceramic capacitor.
18	16	P42	F	General purpose I/O pin.

## ■ HANDLING DEVICES

### 1. Preventing latch-up

CMOS IC may suffer latch-up under the following conditions :

- A voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between  $V_{CC}$  and  $V_{SS}$  pins.
- The  $AV_{CC}$  power supply is applied before the  $V_{CC}$  voltage.

Latch-up may increase the power supply current drastically, causing thermal damage to the device.

For the same reason, also be careful not to let the analog power-supply voltage ( $AV_{CC}$ ,  $AV_{RH}$ ) exceed the digital power-supply voltage.

### 2. Handling unused pins

Leaving unused input pins open may result in misbehavior or latch up and possible permanent damage of the device. Therefore they must be pulled up or pulled down through resistors. In this case those resistors should be more than 2 k $\Omega$  .

Unused bidirectional pins should be set to the output state and can be left open, or the input state with the above described connection.

### 3. Power supply pins ( $V_{CC}/V_{SS}$ )

- If there are multiple  $V_{CC}$  and  $V_{SS}$  pins, from the point of view of device design, pins to be of the same potential are connected the inside of the device to prevent such malfunctioning as latch up. To reduce unnecessary radiation, prevent malfunctioning of the strobe signal due to the rise of ground level, and observe the standard for total output current, be sure to connect the  $V_{CC}$  and  $V_{SS}$  pins to the power supply and ground externally.
- Connect  $V_{CC}$  and  $V_{SS}$  to the device from the current supply source at a low impedance.
- As a measure against power supply noise, connect a capacitor of about 0.1  $\mu\text{F}$  as a bypass capacitor between  $V_{CC}$  and  $V_{SS}$  in the vicinity of  $V_{CC}$  and  $V_{SS}$  pins of the device

### 4. Mode Pin (MD0 to MD2)

Connect the mode pin directly to  $V_{CC}$  or  $V_{SS}$  pins.

To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the mode pins to  $V_{CC}$  or  $V_{SS}$  pins and to provide a low-impedance connection.

# MB90860E Series

## 5. Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply ( $AV_{CC}$ ,  $AV_{RH}$ ,  $AV_{RL}$ ) and analog inputs (AN0 to AN23) after turning-on the digital power supply ( $V_{CC}$ ).

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage not exceed  $AV_{RH}$  or  $AV_{CC}$  (turning on/off the analog and digital power supplies simultaneously is acceptable).

## 6. Connection of Unused Pins of A/D Converter if A/D Converter is used

Connect unused pins of A/D converter to  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AV_{RH} = AV_{RL} = V_{SS}$ .

## 7. Crystal Oscillator Circuit

X0, X1 pins and X0A, X1A pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via shortest distance from X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic oscillator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuit not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

## 8. Pull-up/down resistors

The MB90860E Series does not support internal pull-up/down resistors (Port 0 to Port 3: built-in pull-up resistors). Use external components where needed.

## 9. Using external clock

To use external clock, drive the X0 pin and leave X1 pin open.

## 10. Precautions for when not using a sub clock signal

If you do not connect pins X0A and X1A to an oscillator, use pull-down handling on the X0A pin, and leave the X1A pin open.

## 11. Notes on during operation of PLL clock mode

If the PLL clock mode is selected, the MB90860 series attempt to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.

## 12. Notes on Energization

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50 or more  $\mu s$  (0.2 V to 2.7 V)

## 13. Stabilization of power supply voltage

A sudden change in the supply voltage may cause the device to malfunction even within the specified  $V_{CC}$  supply voltage operating range. Therefore, the  $V_{CC}$  supply voltage should be stabilized.

For the reference, stabilize the supply voltage by setting the following value.

- $V_{CC}$  ripple variations (peak-to-peak value) at commercial frequencies (50 Hz/60 Hz) fall below 10% of the standard  $V_{CC}$  supply voltage
- The coefficient of fluctuation does not exceed 0.1 V/ms at instantaneous power switching.

## 14. Initialization

In the device, there are internal registers which are initialized only by a power-on reset. To initialize these registers, turn on the power again.

## 15. Port 0 to port 3 output during Power-on (External-bus mode)

As shown below, when power is turned on in External-Bus mode, in spite of reset input, there is a possibility that output signal of Port 0 to Port 3 might be unstable.

## 16. Flash security Function

The security bit is located in the area of the flash memory.

If protection code  $01_H$  is written in the security bit, the flash memory is in the protected state by security.

Therefore please do not write  $01_H$  in this address if you do not use the security function.

Please refer to following table for the address of the security bit.

## MEMORY MAP

Note : The high-order portion of bank 00 gives the image of the FF bank ROM to make the small model of the C compiler effective. Since the low-order 16 bits are the same, the table in ROM can be referenced without using the far specification in the pointer declaration.

For example, an attempt to access 00C000H accesses the value at FFC000H in ROM.

The ROM area in bank FF exceeds 32 Kbytes, and its entire image cannot be shown in bank 00.

The image between FF8000H and FFFFFFFH is visible in bank 00, while the image between FF0000H and FF7FFFH is visible only in bank FF.

### 1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	$V_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	
	$AV_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$V_{CC} = AV_{CC}$ *2
	AVRH, AVRL	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$AV_{CC} \geq AVRH$ , $AV_{CC} \geq AVRL$ , $AVRH \geq AVRL$
Input voltage*1	$V_I$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*3
Output voltage*1	$V_O$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*3
Maximum Clamp Current	$I_{CLAMP}$	-4.0	+4.0	mA	*5
Total Maximum Clamp Current	$\Sigma  I_{CLAMP} $	—	40	mA	*5
“L” level maximum output current	$I_{OL}$	—	15	mA	*4
“L” level average output current	$I_{OLAV}$	—	4	mA	*4
“L” level maximum overall output current	$\Sigma I_{OL}$	—	100	mA	*4
“L” level average overall output current	$\Sigma I_{OLAV}$	—	50	mA	*4
“H” level maximum output current	$I_{OH}$	—	-15	mA	*4
“H” level average output current	$I_{OHAV}$	—	-4	mA	*4
“H” level maximum overall output current	$\Sigma I_{OH}$	—	-100	mA	*4
“H” level average overall output current	$\Sigma I_{OHAV}$	—	-50	mA	*4
Power consumption	$P_D$	—	340	mW	
Operating temperature	$T_A$	-40	+105	°C	
Storage temperature	$T_{STG}$	-55	+150	°C	

\*1 : This parameter is based on  $V_{SS} = AV_{SS} = 0$  V.

\*2 : Set  $AV_{CC}$  and  $V_{CC}$  to the same voltage. Make sure that  $AV_{CC}$  does not exceed  $V_{CC}$  and that the voltage at the analog inputs does not exceed  $AV_{CC}$  when the power is switched on.

\*3 :  $V_I$  and  $V_O$  should not exceed  $V_{CC} + 0.3$  V.  $V_I$  should not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the  $I_{CLAMP}$  rating supersedes the  $V_I$  rating.

\*4 : Applicable to pins : P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57, P60 to P67, P70 to P77, P80 to P87, P90 to P97, PA0 to PA1

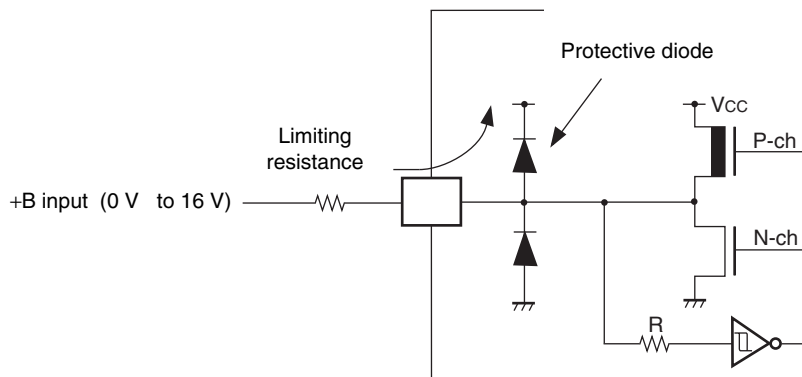

(Continued)

(Continued)

- \*5 :
- Applicable to pins: P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57 (evaluation device : P50 to P55) , P60 to P67, P70 to P77, P80 to P87, P90 to P97, PA0 to PA1
  - Use within recommended operating conditions.
  - Use at DC voltage (current)
  - The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
  - The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the  $V_{CC}$  pin, and this may affect other devices.
  - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V) , the power supply is provided from the pins, so that incomplete operation may result.
  - Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on reset.
  - Care must be taken not to leave the +B input pin open.
  - Sample recommended circuits:

- Input/output equivalent circuits

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Conditions

( $V_{SS} = AV_{SS} = 0\text{ V}$ )

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	$V_{CC}$ , $AV_{CC}$	4.0	5.0	5.5	V	Under normal operation
		3.5	5.0	5.5	V	Under normal operation, when not using the A/D converter and not Flash programming.
		4.5	5.0	5.5	V	When External bus is used.
		3.0	—	5.5	V	Maintains RAM data in stop mode
Smooth capacitor	$C_S$	0.1	—	1.0	$\mu\text{F}$	Use a ceramic capacitor or capacitor of better AC characteristics. Capacitor at the $V_{CC}$ should be greater than this capacitor.
Operating temperature	$T_A$	-40	—	+105	$^{\circ}\text{C}$	

C Pin Connection Diagram

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

## (13) I<sup>2</sup>C Timing

(T<sub>A</sub> = -40°C to +105°C, V<sub>CC</sub> = 5.0 V ± 10%, V<sub>SS</sub> = 0.0 V)

Parameter	Symbol	Condition	Standard-mode		Fast-mode* <sup>1</sup>		Unit
			Min	Max	Min	Max	
SCL clock frequency	f <sub>SCL</sub>	R = 1.7 kΩ, C = 50 pF* <sup>2</sup>	0	100	0	400	kHz
Hold time (repeated) START condition SDA ↓ → SCL ↓	t <sub>HDSTA</sub>		4.0	—	0.6	—	μs
“L” width of the SCL clock	t <sub>LOW</sub>		4.7	—	1.3	—	μs
“H” width of the SCL clock	t <sub>HIGH</sub>		4.0	—	0.6	—	μs
Set-up time for a repeated START condition SCL ↑ → SDA ↓	t <sub>SUSTA</sub>		4.7	—	0.6	—	μs
Data hold time SCL ↓ → SDA ↓ ↑	t <sub>HDDAT</sub>		0	3.45* <sup>3</sup>	0	0.9* <sup>4</sup>	μs
Data set-up time SDA ↓ ↑ → SCL ↑	t <sub>SUDAT</sub>		250	—	100	—	ns
Set-up time for STOP condition SCL ↑ → SDA ↑	t <sub>SUSTO</sub>		4.0	—	0.6	—	μs
Bus free time between a STOP and START condition	t <sub>BUS</sub>	4.7	—	1.3	—	μs	

\*1 : For use at over 100 kHz, set the machine clock to at least 6 MHz.

\*2 : R,C : Pull-up resistor and load capacitor of the SCL and SDA lines.

\*3 : The maximum t<sub>HDDAT</sub> have only to be met if the device does not stretch the “L” width (t<sub>LOW</sub>) of the SCL signal.

\*4 : A Fast-mode I<sup>2</sup>C-bus device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement t<sub>SUDAT</sub> ≥ 250 ns must then be met.

## 6. Definition of A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Non linearity error : Deviation between a line across zero-transition line ( “00 0000 0000” ← → “00 0000 0001” ) and full-scale transition line ( “11 1111 1110” ← → “11 1111 1111” ) and actual conversion characteristics.
- Differential linearity error : Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
- Total error : Difference between an actual value and an ideal value. A total error includes zero transition error, full-scale transition error, and linear error.
- Zero reading voltage : Input voltage which results in the minimum conversion value.
- Full scale reading voltage : Input voltage which results in the maximum conversion value.

$$\text{Total error of digital output "N"} = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$1 \text{ LSB (Ideal value)} = \frac{AVRH - AVRL}{1024} \text{ [V]}$$

$$V_{OT} \text{ (Ideal value)} = AVRL + 0.5 \text{ LSB [V]}$$

$$V_{FST} \text{ (Ideal value)} = AVRH - 1.5 \text{ LSB [V]}$$

V<sub>NT</sub> : A voltage at which digital output transitions from (N - 1) to N.

(Continued)

(Continued)

$$\text{Non linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ LSB [LSB]}$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

$V_{OT}$  : Voltage at which digital output transits from "000H" to "001H."

$V_{FST}$  : Voltage at which digital output transits from "3FEH" to "3FFH."

## 7. Notes on A/D Converter Section

Use the device with external circuits of the following output impedance for analog inputs :

Recommended output impedance of external circuits are : Approx. 1.5 kΩ or lower ( $4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$ , sampling period  $\leq 0.5\text{ }\mu\text{s}$ )

If an external capacitor is used, in consideration of the effect by tap capacitance caused by external capacitors and on-chip capacitors, capacitance of the external one is recommended to be several thousand times as high as internal capacitor.

If output impedance of an external circuit is too high, a sampling period for an analog voltage may be insufficient.
