## 1. GENERAL DESCRIPTION

The W90P710 is built around an outstanding CPU core, the 16/32 ARM7TDMI RISC processor which designed by Advanced RISC Machines, Ltd. It offers 4K-byte I-cache/SRAM and 4K-byte D-cache/SRAM, is a low power, general purpose integrated circuits. Its simple, elegant, and fully static design is particularly suitable for cost sensitive and power sensitive applications.

One 10/100 Mb MAC of Ethernet controller is built-in to reduce total system cost. A LCD controller is also built-in to support TFT and low cost STN LCD modules.

With one USB 1.1 host controller, one USB 1.1 device controller, two smart card host controller, four independent UARTs, one Watchdog timer, up to 71 programmable I/O ports, PS/2 keyboard controller and an advanced interrupt controller, the W90P710 is particularly suitable for point-of-sale (POS), access control and data collector.

The W90P710 also provides one AC97/I<sup>2</sup>S controller, one SD/SDIO host controller, one 2-Channel GDMA, two 24-bit timers with 8-bit pre-scale, The external bus interface (EBI) controller provides for SDRAM, ROM/SRAM, flash memory and I/O devices. The System Manager includes an internal 32-bit system bus arbiter and a PLL clock controller. With a wide range of serial communication and Ethernet interfaces, the W90P710 is also suitable for communication gateways as well as many other general purpose applications.

## 2. FEATURES

### Architecture

- Fully 16/32-bit RISC architecture
- Little/Big-Endian mode supported
- Efficient and powerful ARM7TDMI core
- Cost-effective JTAG-based debug solution

### External Bus Interface

- 8/16/32-bit external bus support for ROM/SRAM, flash memory, SDRAM and external I/Os
- Support for SDRAM
- Programmable access cycle (0-7 wait cycle)
- Four-word depth write buffer for SDRAM write data
- Cost-effective memory-to-peripheral DMA interface

### Instruction and Data Cache

- Two-way, Set-associative, 4K-byte I-cache and 4K-byte D-cache
- Support for LRU (Least Recently Used) Protocol
- Cache can be configured as internal SRAM
- Support Cache Lock function

## **Ethernet MAC Controller**

- DMA engine with burst mode
- MAC Tx/Rx buffers (256 bytes Tx, 256 bytes Rx)
- Data alignment logic
- Endian translation
- 100/10-Mbit per second operation
- Full compliance with IEEE standard 802.3
- RMI interface only
- Station Management Signaling
- On-Chip CAM (up to 16 destination addresses)
- Full-duplex mode with PAUSE feature
- Long/short packet modes
- PAD generation

## **Color LCD Controller (CLCDC)**

### **(1) STN LCD Display**

- Supports Sync-type STN LCD
- Supports 2 types of LCD panels: 4-bit single scan, and 8-bit single scan display type
- Supports 16 gray levels for Monochrome STN LCD panel
- Supports 4096 color for Color STN LCD panel
- Virtual coloring method: Frame Rate Control (16-level)
- Anti-flickering method: Time-based Dithering

### **(2) TFT LCD Display**

- Supports Sync-type TFT LCD and Sync-type High-color TFT LCD
- Supports 8-bpp(RGB332) palette color display
- Supports 12-bpp(RGB444)/16-bpp (RGB565)/18-bpp(RGB666) non-palette true color display

### **(3) TV Encoder**

- Supports 8-bit YCbCr data output format to connect with external TV Encoder

### **(4) LCD Preprocessing**

- Image resize
  - Horizontal/Vertical Down-Scaling
  - Horizontal/Vertical Up-Scaling
- Image relocation
  - Horizontal /Vertical Cropping
  - Virtual Display

## (5) LCD Post processing

- Support for one OSD overlay
- Support various OSD function

## (6) Others

- Color-look up table size 256x32 bit for TFT used
- Dedicated DMA for block transfer mode

## DMA Controller

- 2-channel General DMA for memory-to-memory data transfers without CPU intervention
- Initialed by a software or external DMA request
- Increments or decrements a source or destination address in 8-bit, 16-bit or 32-bit data transfers
- 4-data burst mode

## UART

- Four UART (serial I/O) blocks with interrupt-based operation
- Support for 5-bit, 6-bit, 7-bit or 8-bit serial data transmit and receive
- Programmable baud rates
- 1, ½ or 2 stop bits
- Odd or even parity
- Break generation and detection
- Parity, overrun and framing error detection
- X16 clock mode
- UART1 supports Bluetooth, and UART2 supports IrDA1.0 SIR

## Timers

- Two programmable 24-bit timers with 8-bit pre-scaler
- One programmable 20 bit with selectable additional 8-bit prescaler Watchdog timer
- One-shot mode, periodical mode or toggle mode operation

## Programmable I/Os

- 71 programmable I/O ports
- Pins individually configurable to input, output or I/O mode for dedicated signals
- I/O ports are configurable for Multiple functions

## **Advanced Interrupt Controller**

- 31 interrupt sources, including 6 external interrupt sources
- Programmable normal or fast interrupt mode (IRQ, FIQ)
- Programmable as either edge-triggered or level-sensitive for 6 external interrupt sources
- Programmable as either low-active or high-active for 6 external interrupt sources
- Priority methodology is encoded to allow for interrupt daisy-chaining
- Automatically mask out the lower priority interrupt during interrupt nesting

## **USB Host Controller**

- USB 1.1 compliant
- Compatible with Open HCI 1.0 specification
- Supports low-speed and full speed devices
- Build-in DMA for real time data transfer
- Two on-chip USB transceivers with one optionally shared with USB Device Controller

## **USB Device Controller**

- USB 1.1 compliant
- Support four USB endpoints including one control endpoint and 3 configurable endpoints for rich USB functions

## **Two PLLs**

- The external clock can be multiplied by on-chip PLL to provide high frequency system clock
- The input frequency range is 3-30MHz; 15MHz is preferred.
- One PLL for both CPU and USB host/device controller
- One PLL for LCD pixel clock and audio IIS 12.288/16.934MHz clock source
- Programmable clock frequency

## **Real Time Clock (RTC)**

- 32.768KHz operation
- Time counter (second, minute, hour) and calendar counter (day, month, year)
- Alarm register (second, minute, hour, day, month, year)
- 12 or 24-hour mode selectable
- Recognize leap year automatically
- Day of the week counter
- Frequency compensate register (FCR)
- Beside FCR, all clock and alarm data expressed in BCD code
- Support tick time interrupt

## **4-Channel PWM**

- Four 16-bit timers with PWM
- Two 8-bit pre-scalers & Two 4-bit dividers
- Programmable duty control of output waveform (PWM)
- Auto reload mode or one-shot pulse mode
- Dead-zone generator

## **I2C Master**

- 2-Channel I2C
- Compatible with Philips I<sup>2</sup>C standard, support master mode only
- Support multi master operation
- Clock stretching and wait state generation
- Provide multi-byte transmit operation, up to 4 bytes can be transmitted in a single transfer
- Software programmable acknowledge bit
- Arbitration lost interrupt, with automatic transfer cancellation
- Start/Stop/Repeated Start/Acknowledge generation
- Start/Stop/Repeated Start detection
- Bus busy detection
- Supports 7 bit addressing mode
- Software mode I<sup>2</sup>C

## **Universal Serial Interface (USI)**

- 1-Channel USI
- Support USI (Microwire/SPI) master mode
- Full duplex synchronous serial data transfer
- Variable length of transfer word up to 32 bits
- Provide burst mode operation, transmit/receive can be executed up to four times in one transfer
- MSB or LSB first data transfer
- Rx and Tx on both rising or falling edge of serial clock independently
- Two slave/device select lines
- Fully static synchronous design with one clock domain

## **2-Channel AC97/I2S Audio Codec Host Interface**

- AHB master port and an AHB slave port are offered in audio controller.
- Always 8-beat incrementing burst
- Always bus lock when 8-beat incrementing burst

- When reach middle and end address of destination address, a DMA\_IRQ is requested to CPU automatically

### **Smart Card Host Interface (SCH)**

- ISO-7816 compliant
- PC/SC T=0, T=1 compliant
- 16-byte transmitter FIFO and 16-byte receiver FIFO
- FIFO threshold interrupt to optimize system performance
- Programmable transmission clock frequency
- Versatile baud rate configuration
- UART-like register file structure
- General-purpose C4, C8 channels

### **SD/SDIO Host Interface**

- Directly connect to Secure Digital (SD, MMC or SDIO) flash memory card.
- Supports DMA function to accelerate the data transfer between the internal buffer, external SDRAM, and flash memory card.
- Two 512 bytes internal buffers are embedded inside the controller.
- No SPI mode.

### **KeyPad Scan Interface**

- Scan up to 16 rows by 8 columns with an external 4 to 16 decoder and 4x8 array without auxiliary component
- Programmable debounce time
- One or two keys scan with interrupt and three keys reset function.
- Wakeup CPU from IDLE/Power Down mode

### **PS2 Host Interface**

- APB slave consisted of PS2 protocol.
- Connect IBM keyboard or bar-code reader through PS2 interface.
- Provide hardware scan code to ASCII translation

### **Power management**

- Programmable clock enables for individual peripheral
- IDLE mode to halt ARM Core and keep peripheral working
- Power-Down mode to stop all clocks included external crystal oscillator.
- Exit IDLE by all interrupts
- Exit Power-Down by keypad,USB device and external interrupts

**Operation Voltage Range**

- 3.0 ~ 3.6 V for IO Buffer
- 1.62 ~ 1.98 V for Core Logic

**Operation Temperature Range**

- TBD

**Operating Frequency**

- Up to 80 MHz

**Package Type**

- 176-pin LQFP

## 5. PIN DESCRIPTION

Table 5.1 W90P710 Pins Description

PIN NAME	IO TYPE	DESCRIPTION
<b>Clock &amp; Reset</b>		
EXTAL (15M)	I	15MHz External Clock / Crystal Input
XTAL (15M)	O	15MHz Crystal Output
EXTAL (32768)	I	32768Hz External Clock / Crystal Input(for RTC)
XTAL (32768)	O	32768Hz Crystal Output(for RTC)
nRESET	IS	System Reset, active-low
<b>JTAG Interface</b>		
TCK	IDS	JTAG Test Clock, internal pull-down with 58K ohm
TMS	IUS	JTAG Test Mode Select, internal pull-up with 70K ohm
TDI	IUS	JTAG Test Data in, internal pull-up with 70K ohm
TDO	O	JTAG Test Data out
nTRST	IUS	JTAG Reset, active-low, internal pull-up with 70K ohm
<b>External Bus Interface</b>		
A [21:18]	O	Address Bus (MSB) of external memory and IO devices.
A [17:0]	IOS	Address Bus of external memory and IO devices.
D [31:16] / VD[23:8] / GPIO [67:52]	IO	Data Bus (MSB) of external memory and IO device, internal pull-up with 70K ohm. General Programmable In/Out Port GPIO[67:52].
D [15:0] /	IOS	Data Bus (LSB) of external memory and IO device.
nWBE [3:0] / SDQM [3:0] / GPIO[69:68]	IOS	Write Byte Enable for specific device (nECS [3:0]). Data Bus Mask signal for SDRAM (nSCS [1:0]), active-low. General Programmable In/Out Port [69:68]
nSCS [1:0]	O	SDRAM chip select for two external banks, active-low.
nSRAS	O	Row Address Strobe for SDRAM, active-low.
nSCAS	O	Column Address Strobe for SDRAM, active-low.
nSWE	O	SDRAM Write Enable, active-low
MCKE	O	SDRAM Clock Enable, active-high
MCLK	O	System Master Clock Out, SDRAM clock, output with slew-rate control
nWAIT / GPIO[70] / nIRQ5	IUS	External Wait, active-low. This pin indicates that the external devices need more active cycle during access operation. General Programmable In/Out Port GPIO[70]. If memory and IO devices in EBI do not need wait request, it can be configured as GPIO[7] or nIRQ5
nBTCS	O	ROM/Flash Chip Select, active-low.
nECS [3:0]	IO	External I/O Chip Select, active-low.
nOE	O	ROM/Flash, External Memory Output Enable, active-low.

Table 5.1 W90P710 Pins Description (Continued)

Pin Name	IO Type	Description
<b>Ethernet Interface</b>		
PHY_MDC / GPIO [51] / KPROW[1] / LCD_VD[17]	IOU	RMII Management Data Clock for Ethernet. It is the reference clock of MDIO. Each MDIO data will be latched at the rising edge of MDC clock. General Programmable In/Out Port [51] Keypad ROW[1] scan output. LCD VD[17] data output
PHY_MDIO / GPIO [50] / KPROW[0] / LCD_VD[16]	IO	RMII Management Data I/O for Ethernet. It is used to transfer RMII control and status information between PHY and MAC. General Programmable In/Out Port [51] Keypad ROW[0] scan output. LCD VD[16] data output.
PHY_TXD [1:0] / GPIO [49:48] / KPCOL[7:6] / LCD_VD[15]	IOU	2-bit Transmit Data bus for Ethernet. General programmable In/Out Port [49:48] Keypad Column input [7:6], active low LCD VD[15] data output
PHY_TXEN / GPIO [47] / KPCOL[5] / LCD_VD[14:13]	IOU	PHY_TXEN shall be asserted synchronously with the first 2-bit of the preamble and shall remain asserted while all di-bits to be transmitted are presented. Of course, it is synchronized with PHY_REFCLK. General Programmable In/Out Port [47] Keypad column input [5], active low LCD VD[14:13] data output.
PHY_REFCLK / GPIO [46] / KPCOL[4] / LCD_VD[12]	IOS	Reference Clock. The clock shall be 50MHz +/- 50 ppm with minimum 35% duty cycle at high or low state. General Programmable In/Out port [46] Keypad column input [4], active low LCD VD[12] data output.
PHY_RXD [1:0] / GPIO [45:44] / KPCOL[3:2] / LCD_VD[11:10]	IOS	2-bit Receive Data bus for Ethernet. General Programmable In/Out Port [45:44] Keypad column input [3:2], active low LCD VD[11:10] data output.
PHY_CRSDV / GPIO [43] / KPCOL[1] / LCD_VD[9]	IOS	Carrier Sense / Receive Data Valid for Ethernet. The PHY_CRSDV shall be asserted by PHY when the receive medium is non-idle. Loss of carrier shall result in the de-assertion of PHY_CRSDV synchronous to the cycle of PHY_REFCLK, and only on 2-bit receive data boundaries. General Programmable In/Out port [43] Keypad column input [1], active low LCD VD[9] data output.
PHY_RXERR / GPIO [42] / KPCOL[0] / LCD_VD[8]	IOS	Receive Data Error for Ethernet. It indicates a data error detected by PHY. The assertion should be lasted for longer than a period of PHY_REFCLK. When PHY_RXERR is asserted, the MAC will report a CRC error. General programmable In/Out port [42] Keypad column input [0], active low LCD VD[8] data output.

Table 5.1 W90P710 Pins Description (Continued)

Pin Name	IO Type	Description
<b>AC97/I2S/PWM/UART3</b>		
AC97_nRESET / I2S_MCLK / GPIO [0] / nIRQ4 / USB_PWREN	IOU	AC97 CODEC Host Interface RESET Output. I2S CODEC Host Interface System Clock Output. General Purpose In/Out port [0] External interrupt request. USB host power enable output
AC97_DATAI / I2S_DATAI / PWM [0] / DTR4 / GPIO [1]	IOU	AC97 CODEC Host Interface Data Input. I2S CODEC Host Interface Data Input. PWM Channel 0 Output. Data Terminal Ready for UART4. General Purpose In /Out port [1]
AC97_DATAO / I2S_DATAO / PWM [1] / DSR4 / GPIO [2]	IOU	AC97 CODEC Host Interface Data Output. I2S CODEC Host Interface Data Output. PWM Channel 1 Output. Data Set Ready for UART4. General Purpose In/Out port [2]
AC97_SYNC / I2S_LRCLK / PWM [2] / TXD4 / GPIO [3]	IOU	AC97 CODEC Host Interface Synchronous Pulse Output. I2S CODEC Host Interface Left/Right Channel Select Clock. PWM Channel 2 Output. Transmit Data for UART4. General Purpose In/Out port [3]
AC97_BITCLK / I2S_BITCLK / PWM [3] / RXD4 / GPIO [4]	IOS	AC97 CODEC Host Interface Bit Clock Input. I2S CODEC Host Interface Bit Clock. PWM Channel 3 Output. Receive Data for UART4. General Purpose In/Out port [4].
<b>USB Interface</b>		
DP0	IO	Differential Positive USB IO signal
DN0	IO	Differential Negative USB IO signal
DP1	IO	Differential Positive USB IO signal
DN1	IO	Differential Negative USB IO signal
<b>Miscellaneous</b>		
nIRQ [3:2] / GPIO [19:18]	IOU	External Interrupt Request General Purpose I/O.
nIRQ [1:0] / GPIO [17:16] USB_OVRCUR	IOU	External Interrupt Request General Purpose I/O nIRQ1 is used as USB host over-current detection input
nWDOG / GPIO [15] / USB_PWREN	IOU	Watchdog Timer Timeout Flag and Keypad 3-keys reset output, active low General Purpose In/output USB host power switch enable output
RTCVDD	P	RTC independent battery power (1.8V)

Table 5.1 W90P710 Pins Description (Continued)

Pin Name	IO Type	Description
<b>I2C/USI</b>		
SCL0 / SFRM / Timer0 / GPIO [11]	IOU	I2C Serial Clock Line 0. USI Serial Frame. Timer0 time out output. General Purpose In/Out port [11].
SDA0 / SSPTXD / Timer1 / GPIO [12]	IOU	I2C Serial Data Line 0 USI Serial Transmit Data Timer1 time out output General Purpose In/Out port [12]
SCL1 / SCLK / GPIO [13] KPROW[3]	IOU	I2C Serial Clock Line 1 USI Serial Clock General Purpose In/Out port [13] Keypad row scan output [3]
SDA1 / SSPRXD / GPIO [14] / KPROW[2]	IDU	I2C Serial Data Line 1 USI Serial Receive Data General Purpose In/Out port [14] Keypad scan output [2]
<b>UART0/UART1/UART2</b>		
TXD0 / GPIO [5]	IOU	UART0 Transmit Data. General Purpose In/Out [5]
RXD0 / GPIO [6]	IOU	UART0 Receive Data. General Purpose In/Out [6]
TXD1 / GPIO [7]	IOU	UART1 Transmit Data. General Purpose In/Out [7]
RXD1 / GPIO [8]	IOU	UART1 Receive Data. General Purpose In/Out [8]
CTS1/ TXD2(IrDA) / PS2_CLK / GPIO [9]	IOU	UART1 Clear To Send for Bluetooth application UART2 Transmit Data supporting SIR IrDA. PS2 Interface Clock Input/Output General Purpose In/Out [9]
RTS1/ RXD2(IrDA) / PS2_DATA / GPIO [10]	IOU	UART1 Request To Send for Bluetooth application UART2 Receive Data supporting SIR IrDA. PS2 Interface Bi-Directional Data Line. General Purpose In/Out [10]
<b>SCHI/SDIO/XDMA</b>		
SC0_DAT/ SD_CMD / GPIO [29] / LCD_VD[17]	IOU	Smart Card I/O Contact to Card 0. SD/SDIO Mode – Command/Response; General Purpose In/Out [29] LCD data bus [17]
SC0_CLK / SD_CLK / GPIO [28] / LCD_VD[16]	IO	Smart Card Clock Output to Card 0. SD/SDIO Mode – Clock; General Purpose In/Out [28] LCD data bus [16]

Table 5.1 W90P710 Pins Description (Continued)

Pin Name	IO Type	Description
<b>SCHI/SDIO/XDMA</b>		
SC0_RST / SD_DAT0 / GPIO [27] / LCD_VD[15]	IO	Smart Card Reset Output to Card 0. SD/SDIO Mode – Data Line Bit 0; General Purpose In/Out [27] LCD data bus [15]
SC0_PRES / SD_DAT1 / GPIO [26] LCD_VD[14]	IO	Smart Card 0 Presence Contact Input. SD/SDIO Mode – Data Line Bit 1. General Purpose In/Out [26] LCD data bus [14]
SC0_nPWR / SD_DAT2 / GPIO [25] / LCD_VD[13]	IO	Smart Card 0 Power FET Control Signal Output. SD/SDIO Mode – Data Line Bit 2. General Purpose In/Out [25] LCD data bus [13]
SC1_DAT / SD_DAT3 / GPIO [24] / LCD_VD[12]	IO	Smart Card I/O Contact to Card 1. SD/SDIO Mode – Data Line Bit 3; General Purpose In/Out [24] LCD data bus [12]
SC1_CLK / GPIO [23] / LCD_VD[11]	IO	Smart Card Clock Output to Card 1. General Purpose In/Out [23] LCD data bus [11]
SC1_RST / SD_CD / GPIO [22] / LCD_VD[10]	IO	Smart Card Reset Output to Card 1. SD/SDIO Mode – Card Detect. General Purpose In/Out [22] LCD data bus [10]
SC1_PRES / nXDREQ / GPIO [21] / LCD_VD[9]	IO	Smart Card 1 Presence Contact Input. External DMA Request. General Purpose In/Out [21] LCD data bus [9]
SC1_nPWR / nXDACK / GPIO [20] / LCD_VD[8]	IO	Smart Card 1 Power FET Control Signal Output. External DMA Acknowledgement. General Purpose In/Out [20] LCD data bus [8]
<b>Color LCD Interface</b>		
VD [7:0] / GPIO [41:34]	IOU	LCD Pixel Data Output. General Purpose In/Out [41:34]
HSYNC / GPIO [33]	IOU	Horizontal Sync or Line Sync. General Purpose In/Out [33]
VSYNC / GPIO [32]	IOU	Vertical Sync or Frame Sync. General Purpose In/Out [32]
VDEN / GPIO [31]	IOU	Data Enable or Display Control Signal. General Purpose In/Out [31]
VCLK / GPIO [30]	IOU	Pixel Clock. General Purpose In/Out [30]

6. BLOCK DIAGRAM

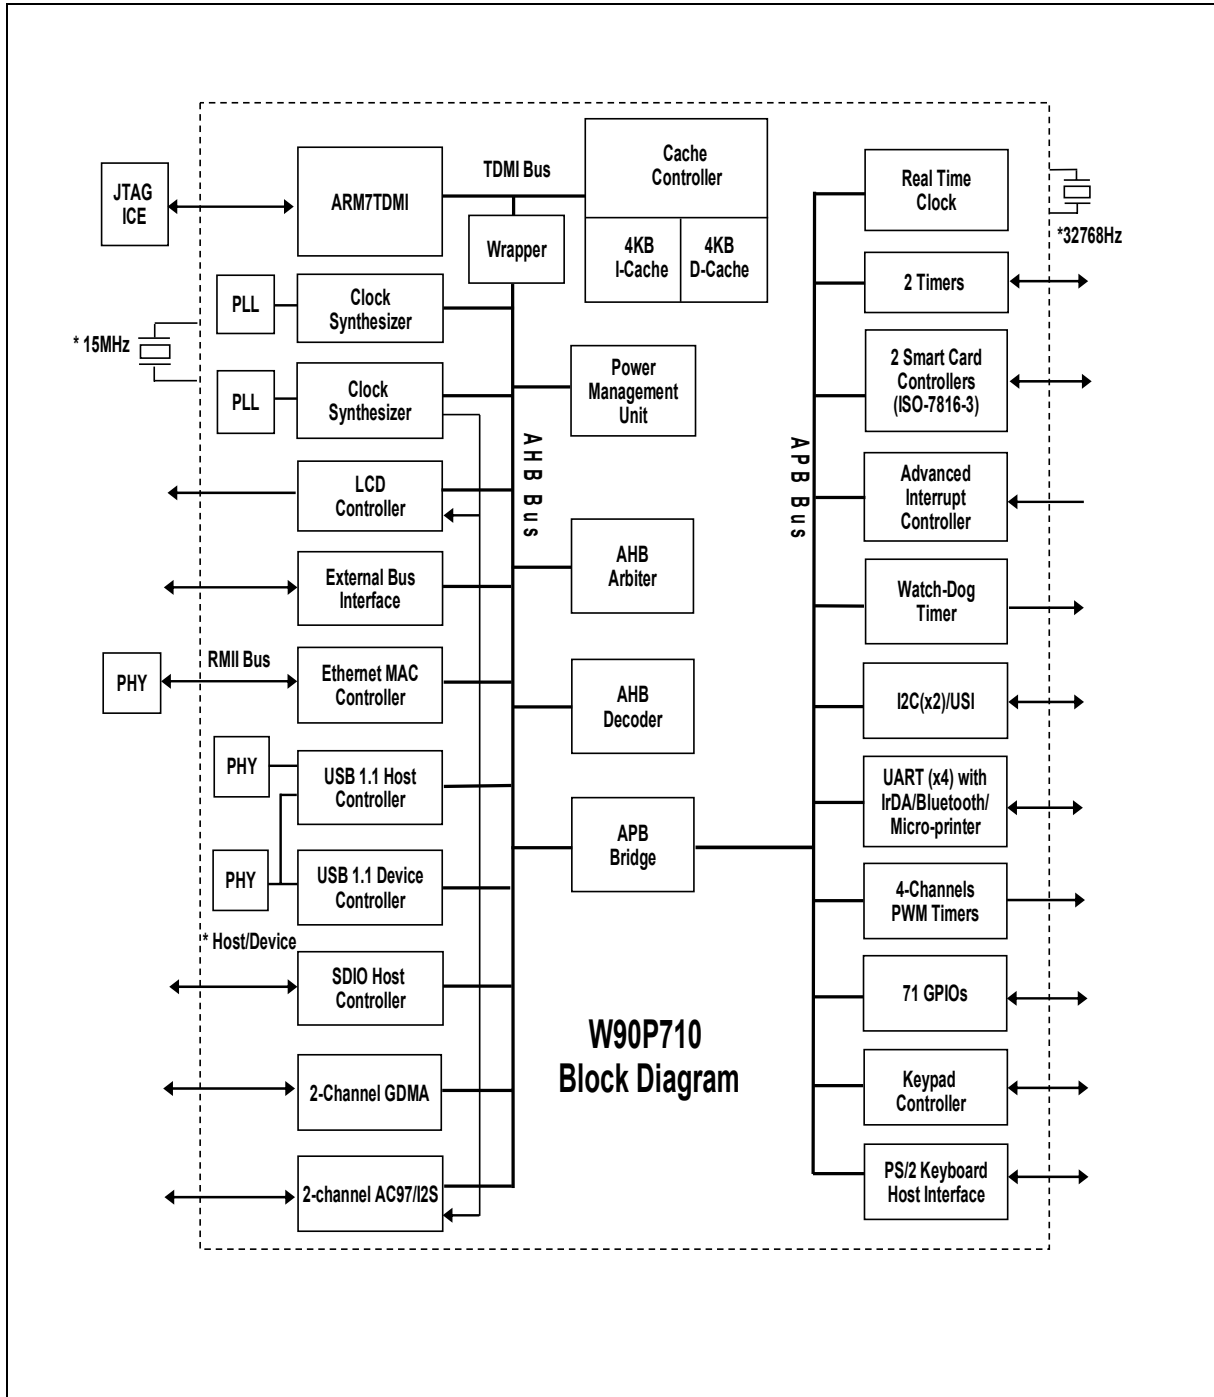

Fig 6.1 W90P710 Functional Block Diagram

## 7. FUNCTIONAL DESCRIPTION

### 7.1 ARM7TDMI CPU CORE

The ARM7TDMI CPU core is a member of the Advanced RISC Machines (ARM) family of general-purpose 32-bit microprocessors, which offer high performance for very low power consumption. The architecture is based on Reduced Instruction Set Computer (RISC) principles, and the instruction set and related decode mechanism are much simpler than those of micro-programmed Complex Instruction Set Computers. Pipelining is employed so that all parts of the processing and memory systems can operate continuously. The high instruction throughput and impressive real-time interrupt response are the major benefits.

The ARM7TDMI CPU core has two instruction sets:

- (1) The standard 32-bit ARM set
- (2) A 16-bit THUMB set

The THUMB set's 16-bit instruction length allows it to approach twice the density of standard ARM core while retaining most of the ARM's performance advantage over a traditional 16-bit processor using 16-bit registers. THUMB instructions operate with the standard ARM register configuration, allowing excellent interoperability between ARM and THUMB states. Each 16-bit THUMB instruction has a corresponding 32-bit ARM instruction with the same effect on the processor model.

ARM7TDMI CPU core has 31 x 32-bit registers. At any one time, 16 sets are visible; the other registers are used to speed up exception processing. All the register specified in ARM instructions can address any of the 16 registers. The CPU also supports 5 types of exception, such as two levels of interrupt, memory aborts, attempted execution of an undefined instruction and software interrupts.

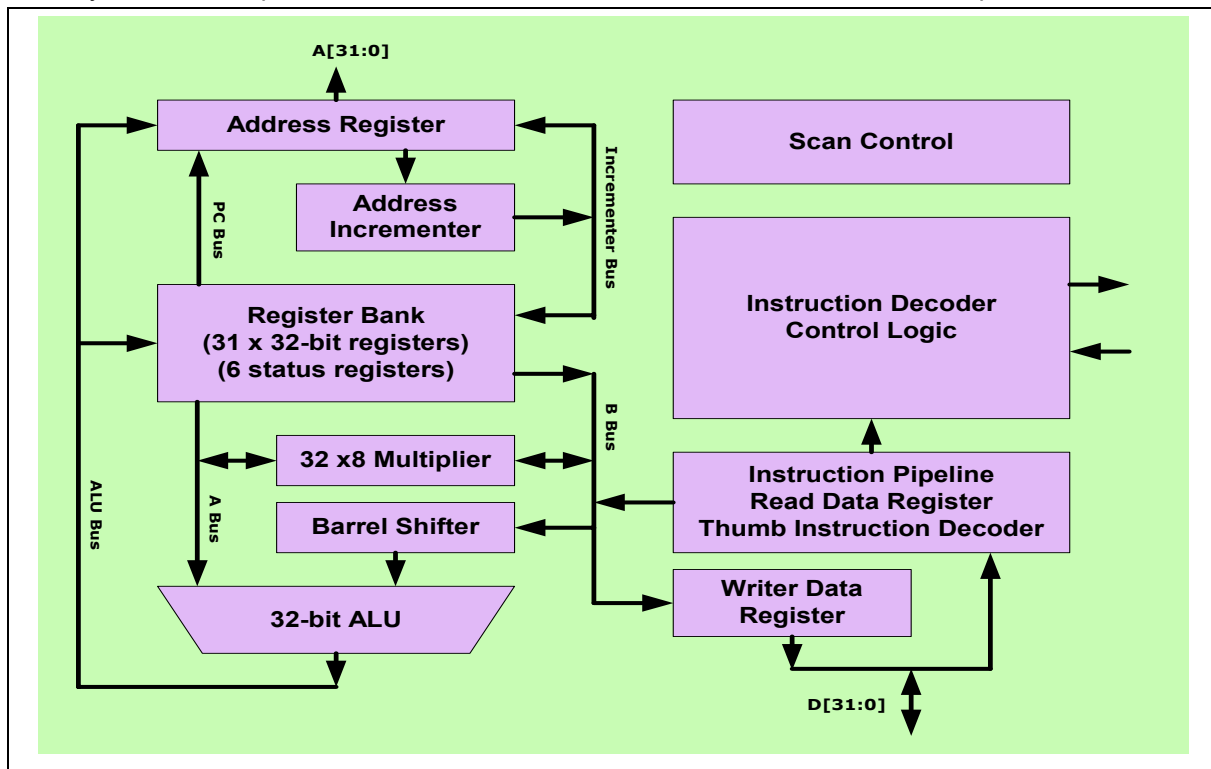

Fig 7.1 ARM7TDMI CPU Core Block Diagram

## 7.2 System Manager

### 7.2.1 Overview

The W90P710 System Manager has the following functions.

- System memory map
- Data bus connection with external memory
- Product identifier register
- Bus arbitration
- PLL module

### 7.2.2 System Memory Map

W90P710 provides 2G bytes cacheable address space and the other 2G bytes are non-cacheable. The On-Chip Peripherals bank is on 1M bytes top of the space (0xFFFF0\_0000 – 0xFFFF\_FFFF) and the On-Chip RAM bank's start address is 0xFFE0.0000, the other banks can be located anywhere (cacheable space: 0x0000\_0000~0x7FDF\_FFFF if Cache ON; non-cacheable space: 0x8000\_0000~0xFFDF\_FFFF).

The size and location of each bank is determined by the register settings for "current bank base address pointer" and "current bank size". Please note that when setting the bank control registers, the address boundaries of consecutive banks must not overlap.

Except On-Chip Peripherals and On-Chip RAM, the start address of each memory bank is not fixed. You can use bank control registers to assign a specific bank start address by setting the bank's base pointer (13 bits). The address resolution is 256K bytes. The bank's start address is defined as "base pointer << 18" and the bank's size is "current bank size".

In the event of an access requested to an address outside any programmed bank size, an abort signal is generated. The maximum accessible memory size of each external IO bank is 16M bytes (by word format), and 64M bytes on each SDRAM bank.

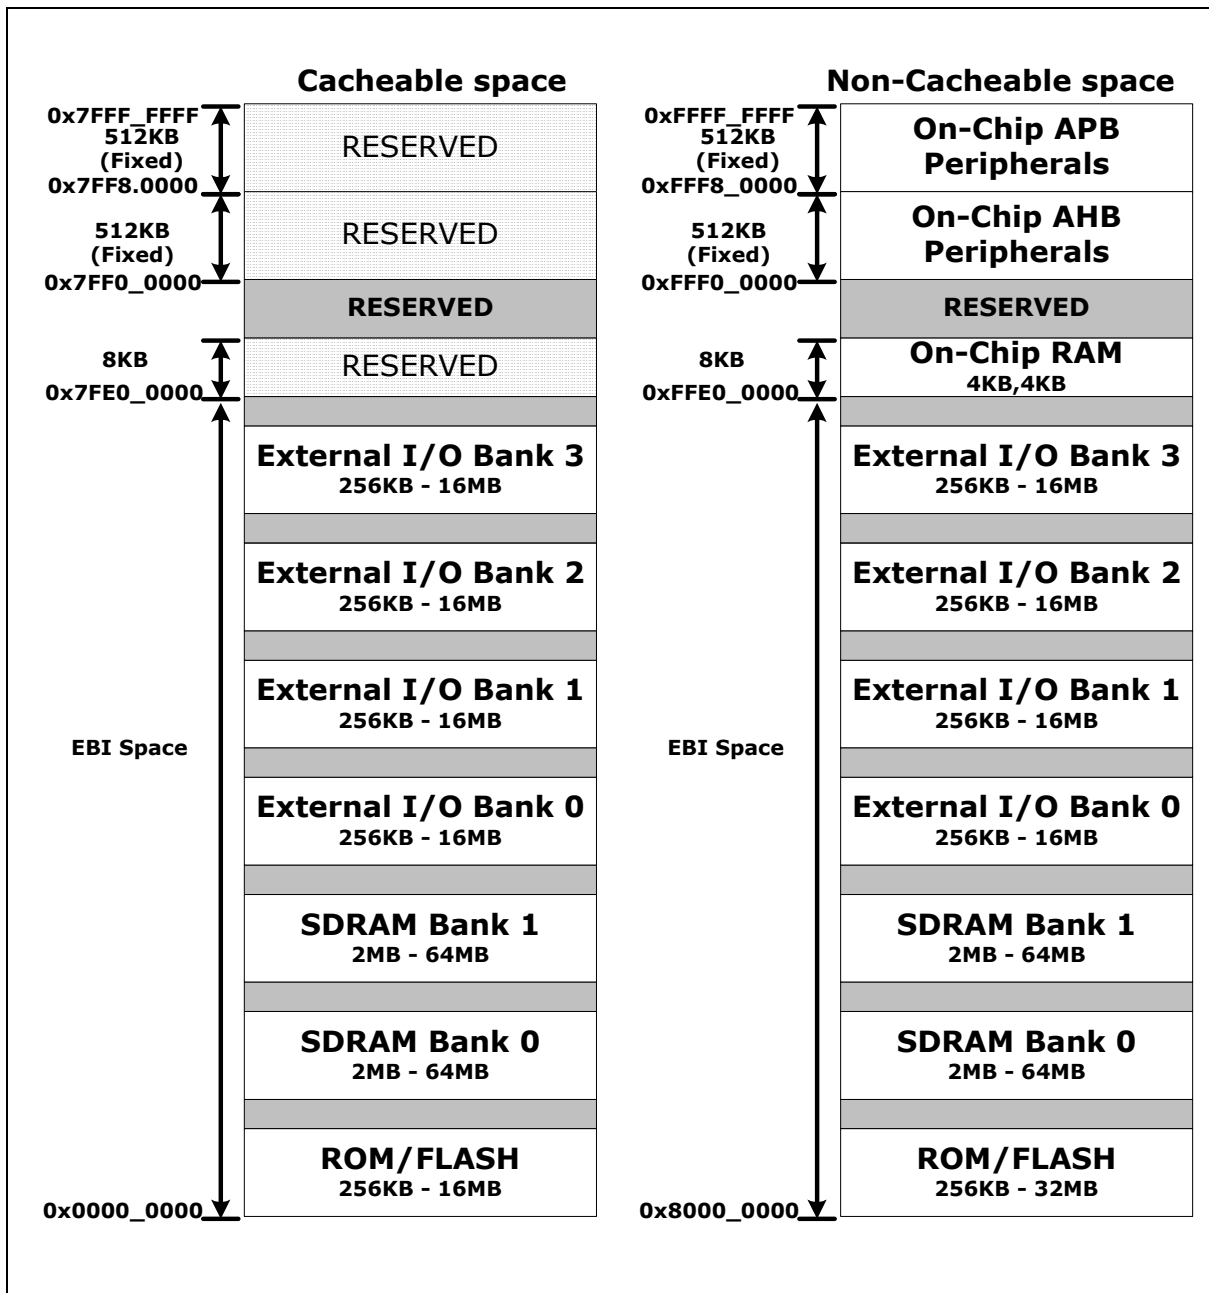

Fig7.2.1 System Memory Map

Table 7.2.1 On-Chip Peripherals Memory Map

BASE ADDRESS	DESCRIPTION
<b>AHB Peripherals</b>	
0xFFFF0_0000	Product Identifier Register (PDID)
0xFFFF0_0004	Arbitration Control Register (ARBCON)
0xFFFF0_0008	PLL Control Register 0(PLLCON0)
0xFFFF0_000C	Clock Select Register (CLKSEL)
0xFFFF0_0010	PLL Control Register 1 (PLLCON1)
0xFFFF0_0014	Audio IIS Clock Control Register (I2SCKCON)
0xFFFF0_0020	IRQ Wakeup Control Register (IRQWAKEUPCON)
0xFFFF0_0024	IRQ Wakeup Flag Register (IRQWAKEFLAG)
0xFFFF0_0028	Power Manager Control Register (PMCON)
0xFFFF0_0030	USB Transceiver Control Register (USBTXRCON)
0xFFFF0_1000	EBI Control Register (EBICON) Control Registers
0xFFFF0_1004	ROM/FLASH (ROMCON) Control Registers
0xFFFF0_1008	SDRAM bank 0 – 1 Control Registers
0xFFFF0_1018	External I/O 0 – 3 Control Registers
0xFFFF0_2000	Cache Controller Control Registers
0xFFFF0_3000	Ethernet MAC Controller Control Registers
0xFFFF0_4000	GDMA 0 – 1 Control Registers
0xFFFF0_5000	USB Host Controller Control Registers
0xFFFF0_6000	USB Device Controller Control Registers
0xFFFF0_7000	SDIO Host Controller Control Registers
0xFFFF0_8000	LCD Controller Control Registers
0xFFFF0_9000	AC97/I2S Controller Control Registers
<b>APB Peripherals</b>	
0xFFFF8_0000	UART 0 (Tx, RX for console)
0xFFFF8_0100	UART 1 (Tx, Rx, for blue-tooth)
0xFFFF8_0200	UART 2 (blue-tooth CTS, RTS/ IrDA Tx, Rx)
0xFFFF8_0300	UART 3 (micro-print DTR, DTS, Tx, Rx)
0xFFFF8_1000	Timer 0 – 1, WDOG Timer
0xFFFF8_2000	Interrupt Controller
0xFFFF8_3000	GPIO
0xFFFF8_4000	Real Time Clock Controller Control Registers (RTC)
0xFFFF8_5000	Smart Card Host Interface Control Registers (SCH1)
0xFFFF8_6000	I2C-0 Control Registers
0xFFFF8_6100	I2C-1 Control Registers
0xFFFF8_6200	USI Control Registers

Table 7.2.1 On-Chip Peripherals Memory Map (Continued)

BASE ADDRESS	DESCRIPTION
<b>APB Peripherals</b>	
0xFFF8_7000	Pulse Width Modulation (PWM) Control Registers
0xFFF8_8000	KeyPad Interface Control Register (KPI)
0xFFF8_9000	PS2 Control Registers

### 7.2.3 Address Bus Generation

The W90P710 address bus generation is depended on the required data bus width of each memory bank. The data bus width is determined by **DBWD** bits in each bank's control register.

The maximum accessible memory size of each external IO bank is 16M bytes.

Table 7.2.2 Address Bus Generation Guidelines

DATA BUS WIDTH	EXTERNAL ADDRESS PINS	MAXIMUM ACCESSIBLE MEMORY SIZE
	<b>A [21:0]</b>	
8-bit	A21 – A0 (Internal)	4M bytes
16-bit	A22 – A1 (Internal)	4M half-words
32-bit	A23 – A2 (Internal)	4M words

### 7.2.4 Data Bus Connection with External Memory

#### 7.2.4.1. Memory formats

The W90P710 can be configured as big endian or little endian mode by pull up or down the external data bus D14 pin. If D14 is pull-up then it is a little endian mode, otherwise, it is a big endian mode.

#### Little endian

In little endian format, the lowest addressed byte in a word is considered the least significant byte of the word and the highest addressed byte is the most significant. So the byte at address 0 of the memory system connects to data lines 7 through 0.

For a word aligned address A, Fig7.2.2 shows how the word at address A, the half-word at addresses A and A+2, and the bytes at addresses A, A+1, A+2, and A+3 map on to each other when **D14** pin is High.

Fig7.2.2 Little endian addresses of bytes and half-words within words

## Big endian

In Big endian format, the W90P710 stores the most significant byte of a word at the lowest numbered byte, and the least significant byte at the highest-numbered byte. So the byte at address 0 of the memory system connects to data lines 31 through 24.

For a word aligned address A, Fig7.2.3 shows how the word at address A, the half-word at addresses A and A+2, and the bytes at addresses A, A+1, A+2, and A+3 map on to each other when the **D14** pin is Low.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Half-word at address A																Half-word at address A+2															
Byte at address A								Byte at address A+1								Byte at address A+2								Byte at address A+3							

Fig7.2.3 Big endian addresses of bytes and half-words within words

### 7.2.4.2. Connection of External Memory with Various Data Width

The system diagram for W90P710 connecting with the external memory is shown in Fig7.2.4. Below tables (Table7.2.3 through Table7.2.14) show the program/data path between CPU register and the external memory using little / big endian and word/half-word/byte access.

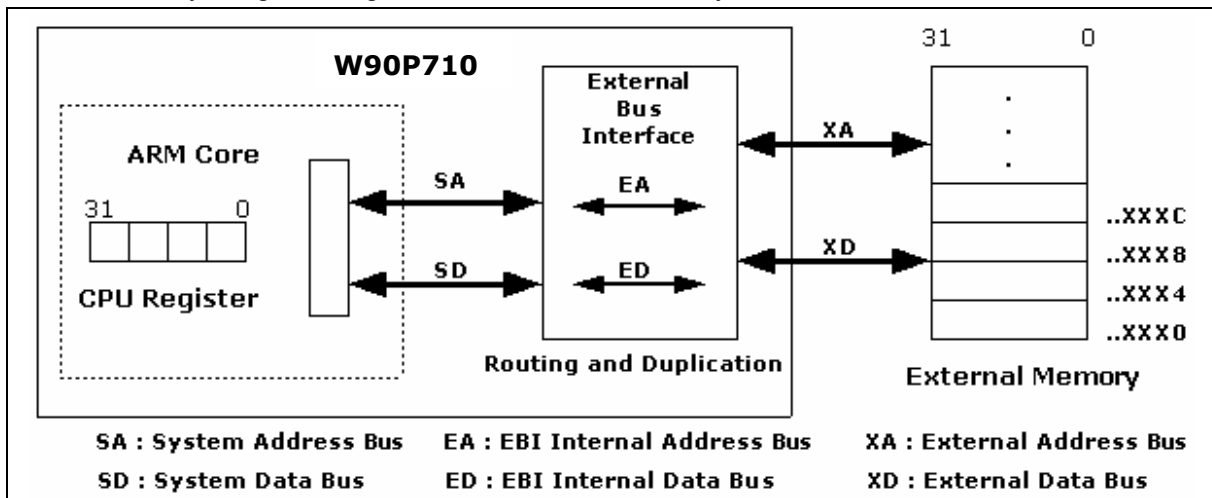

Fig7.2.4 Address/Data bus connection with external memory

## 7.2.5 Bus Arbitration

The W90P710's internal function blocks or external devices can request mastership of the system bus and then hold the system bus in order to perform data transfers. Because the design of W90P710 bus allows only one bus master at a time, a bus controller is required to arbitrate when two or more internal units or external devices simultaneously request bus mastership. When bus mastership is granted to an internal function block or an external device, other pending requests are not acknowledged until the previous bus master has released the bus.

W90P710 supports two priority modes, the **Fixed Priority Mode** and the **Rotate Priority Mode**, depends on the ARBCON register **PRTMOD** bit setting.

### 7.2.5.1. Fixed Priority Mode

In **Fixed Priority Mode** (**PRTMOD**=0, default value), to facilitate bus arbitration, priorities are assigned to each internal W90P710 function block. The bus controller arbitration requests for the bus mastership according to these fixed priorities. In the event of contention, mastership is granted to the function block with the highest assigned priority. These priorities are listed in Table 7.2.15.

W90P710 allows raising ARM Core priority to second if an unmasked interrupt occurred. If **IPEN** bit, Bit 1 of the **Arbitration Control Register (ARBCON)**, is set to "0", the priority of ARM Core is fixed to lowest. If **IPEN** bit is set to "1" and if no unmasked interrupt request, then the ARM Core's priority is still lowest and the **IPACT**=0, Bit 2 of the **Arbitration Control Register (ARBCON)** ; If there is an unmasked interrupt request, then the ARM Core's priority is raised to second and **IPACT**=1.

If **IPEN** is set, an interrupt handler will normally clear **IPACT** at the end of the interrupt routine to allow an alternate bus master to regain the bus; however, if **IPEN** is cleared, no additional action need be taken in the interrupt handler. The **IPACT** bit can be read and written. Writing with "0", the **IPACT** bit is cleared, but it will be no effect as writing with "1".

**Table 7.2.15 Bus Priorities for Arbitration in Fixed Priority Mode**

BUS PRIORITY	FUNCTION BLOCK	
	IPACT = 0	IPEN = 1 AND IPACT = 1
1 (Highest)	Audio Controller (AC97 & I2S)	ARM Core
2	LCD	Audio Controller (AC97 & I2S)
3	General DMA0	LCD Controller
4	General DMA1	General DMA0
5	EMC DMA	General DMA1
6	SDIO	EMC DMA
7	USB Host	SDIO
8	USB Device	USB Host
9(Lowest)	ARM Core	USB Device

### 7.2.5.2. Rotate Priority Mode

In **Rotate Priority Mode (PRTMOD=1)**, the **IPEN** and **IPACT** bits have no function (i.e. can be ignored). W90P710 uses a round robin arbitration scheme ensures that all bus masters have equal chance to gain the bus and that a retracted master does not lock up the bus.

### 7.2.6 Power management

W90P710 provide three power management scenarios to reduce power consumption. The peripherals' clocks can be enabled / disabled individually by controlling the co-responding bit in **CLKSEL** control register. Software can turn-off the unused modules' clocks to saving the unnecessary power consumption. It also provides **idle** and **power-down** modes to reduce power consumption.

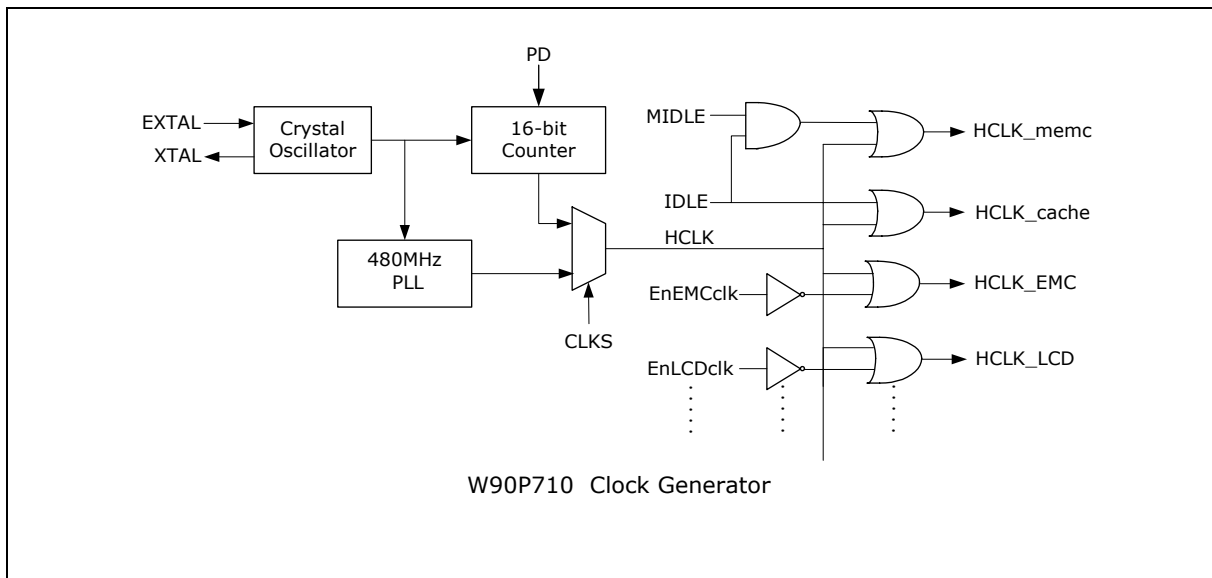

Fig. 7.2.6 W90P710 system clock generation diagram

### IDLE MODE

If the **IDLE** bit in Power Management Control Register (PMCON) is set, the ARM CORE clock source will be halted, the ARM CORE will not go forward. The AHB or APB clocks still active except the clock to cache controller and ARM are stopped. W90P710 will exit idle state when nIRQ or nFIQ from any peripheral is revived; like keypad, timer overflow interrupts and so on. The memory controller can also be forced to enter idle state if both **MIDLE** and **IDLE** bits are set. Software must switch SDRAM into self-refresh mode before forcing memory to enter idle mode.

Fig. 7.2.7 Clock management for system idle mode

Fig. 7.2.8 Clock management for system and memory idle mode

## Power Down Mode

This mode provides the minimum power consumption. When the W90P710 system is not working or waiting an external event, software can write PD bit "1" to turn off all the clocks includes system crystal oscillator to let ARM CORE enter sleep mode. In this state, all peripherals are also in sleep mode since the clock source is stopped. W90P710 will exit power down state when nIRQ/nFIQ is detected. W90P710 provides external interrupt nIRQ[3:0], keypad, and USB device interfaces to wakeup the system clock.

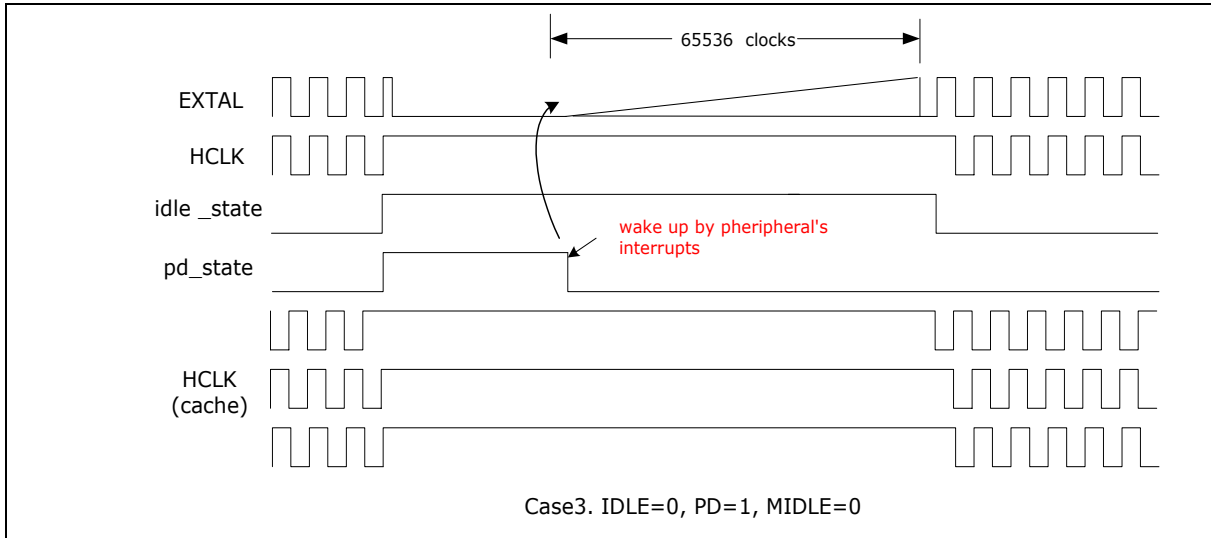

Fig 7.2.9 Clock management for system power down mode and wake up

## 7.2.7 Power-On Setting

After power on reset, there are eight Power-On setting pins to configure W90P710 system configuration.

POWER-ON SETTING	PIN
Internal System Clock Select	D15
Little/Big Endian Mode Select	D14
Boot ROM/FLASH Data Bus Width	D [13:12]
Default (Always pull-up in normal operation)	D [11:8]

### D15 pin : Internal System Clock Select

If pin D15 is pull-down, the external clock from EXTAL pin is served as internal system clock.

If pin D15 is pull-up, the PLL output clock is used as internal system clock.

### D14 pin : Little/Big Endian Mode Select

If pin D14 is pull-down, the external memory format is Big Endian mode.

If pin D14 is pull-up, the external memory format is Little Endian mode.

### D [13:12] : Boot ROM/FLASH Data Bus Width

D [13:12]		BUS WIDTH
Pull-down	Pull-down	8-bit
Pull-down	Pull-up	16-bit
Pull-up	Pull-down	32-bit
Pull-up	Pull-up	RESERVED

[0]	PRTMOD	<p><b>Priority mode select</b> 0 = Fixed Priority Mode (default) 1 = Rotate Priority Mode</p>

**PLL Control Register0 ( PLLCON0 )**

W90P710 provides two clock generation options – crystal and oscillator. The external clock via **EXTAL(15M)** Minput pin as the reference clock input of **PLL** module. The external clock can bypass the **PLL** and be used to the internal system clock by pull-down the data D15 pin. Using **PLL**'s output clock for the internal system clock, D15 pin must be pull-up.

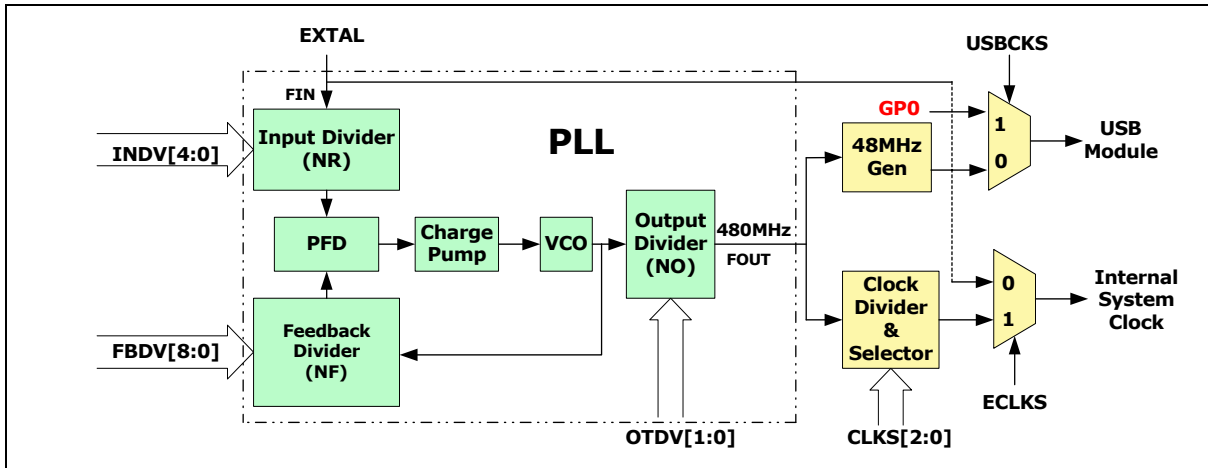

Fig 7.2.8.1 System PLL block diagram

The formula of output clock of PLL is:

$$F_{OUT} = F_{IN} * \frac{NF}{NR} * \frac{1}{NO}$$

F<sub>OUT</sub> : Output clock of **Output Divider**

F<sub>IN</sub> : External clock into the **Input Divider**

NR : Input divider value (NR = INDV + 2)

NF : Feedback divider value (NF = FBDV + 2)

NO : Output divider value (NO = OTDV)

## 7.3 External Bus Interface

### 7.3.1 EBI Overview

W90P710 supports External Bus Interface (**EBI**), which controls the access to the external memory (ROM/FLASH, SDRAM) and External I/O devices. The **EBI** has seven chip selects to select one ROM/FLASH bank, two SDRAM banks, and four External I/O banks. The address bus is 22 bits. It supports 8-bit, 16-bit, and 32-bit external data bus width for each bank.

The EBI has the following functions :

- SDRAM controller
- EBI control register
- ROM/FLASH interface
- External I/O interface
- External bus mastership

### 7.3.2 SDRAM Controller

The SDRAM controller module within W90P710 contains configuration registers 、 timing control registers 、 common control register and other logic to provide 8 、 16 、 32 bits SDRAM interface with a single 8 、 16 、 32 bits SDRAM device or two 8-bit devices wired to give a 16-bit data path or two 16-bit devices wired to give a 32-bit data path. The maximum size of each bank is 64M bytes, and maximum memory size can span up to 128MB.

The SDRAM controller has the following features :

- Supports up to 2 external SDRAM banks
- Maximum size of each bank is 64M bytes
- 8 、 16 、 32-bit data interface
- Programmable CAS Latency : 1 、 2 and 3
- Fixed Burst Length : 1
- Sequential burst type
- Auto Refresh Mode and Self Refresh Mode
- Adjustable Refresh Rate
- Power up sequence

## 7.3.2.1. SDRAM Components Supported

Table 7.3.2.1 SDRAM supported by W90P710

SIZE	TYPE	BANKS	ROW ADDRESSING	COLUMN ADDRESSING

256M bits	32Mx8	4	RA0~RA12	CA0~CA9
	16Mx16	4	RA0~RA12	CA0~CA8

### AHB Bus Address Mapping to SDRAM Bus

**Note:** \* indicates the signal is not used; \*\* indicates the signal is fixed at logic 0 and is not used;

The HADDR prefixes have been omitted on the following tables.

A14 ~ A0 are the Address pins of the W90P710 EBI interface;

A14 and A13 are the Bank Select Signals of SDRAM.

### SDRAM Data Bus Width: 32-bit

### 7.3.2.2. SDRAM Power Up Sequence

The SDRAM must be initialized predefined manner after power on. W90P710 SDRAM Controller automatically executes the commands needed for initialization and set the mode register of each bank to default value. The default value is :

- Burst Length = 1
- Burst Type = Sequential (fixed)
- CAS Latency = 2
- Write Burst Length = Burst (fixed)

The value of mode register can be changed after power up sequence by setting the value of corresponding bank's configuration register "LENGTH" and "LATENCY" bits and set the MRSET bit enable to execute the Mode Register Set command.

### 7.3.2.3. SDRAM Interface

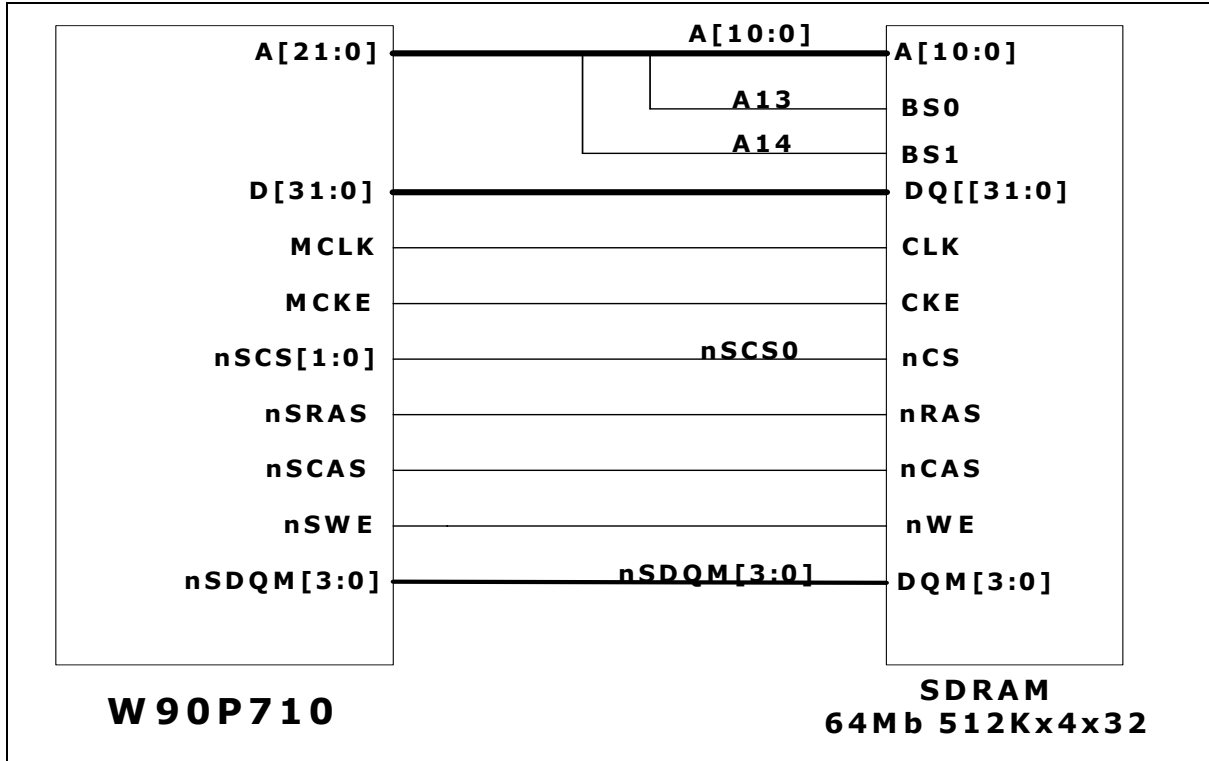

Fig 7.3.1 SDRAM Interface

## Configuration Registers (SDCONF0/1)

The configuration registers enable software to set a number of operating parameters for the SDRAM controller. There are two configuration registers SDCONF0 · SDCONF1 for SDRAM bank 0 · bank 1 respectively. Each bank can have a different configuration.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
SDCONF0	0xFFFF0_1008	R/W	SDRAM bank 0 configuration register	0x0000_0800
SDCONF1	0xFFFF0_100C	R/W	SDRAM bank 1 configuration register	0x0000_0800

## External I/O Control Registers ( EXT0CON – EXT3CON )

The W90P710 supports an external device control without glue logic. It is very cost effective because address decoding and control signals timing logic are not needed. Using these control registers you can configure special external I/O devices for providing the low cost external devices control solution.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
EXT0CON	0xFFFF0_1018	R/W	External I/O 0 control register	0x0000_0000
EXT1CON	0xFFFF0_101C	R/W	External I/O 1 control register	0x0000_0000
EXT2CON	0xFFFF0_1020	R/W	External I/O 2 control register	0x0000_0000
EXT3CON	0xFFFF0_1024	R/W	External I/O 3 control register	0x0000_0000

## 7.4 Cache Controller

The W90P710 incorporates a 4KB Instruction cache, 4KB Data cache and 8 words write buffer. The I-Cache and D-Cache have similar organization except the cache size. To raise the cache-hit ratio, these two caches are configured two-way set associative addressing. Each cache has four words cache line size. When a miss occurs, four words must be fetched consecutively from external memory. The replacement algorithm is a LRU (Least Recently Used).

If disabling the I-Cache / D-Cache, these cache memories can be treated as On-Chip RAM. The W90P710 also provides a write buffer to improve system performance. The write buffer can buffer up to eight words of data.

### 7.4.1 On-Chip RAM

If I-Cache or D-Cache is disabled, it can be served as On-Chip RAM. If D-Cache is disabled, there has 4KB On-Chip RAM, its start address is 0xFFE01000. If I-Cache is disabled, there has 4KB On-Chip RAM and the start address of this RAM is 0xFFE00000. If both the I-Cache and D-Cache are disabled, it has 8KB On-Chip RAM starting from 0xFFE00000.

The size of On-Chip RAM is depended on the I-Cache and D-Cache enable bits **ICAEN**, **DCAEN** in Cache Control Register (CAHCON).

**Table7.4.1 The size and start address of On-Chip RAM**

ICAEN	DCAEN	ON-CHIP RAM	
		SIZE	START ADDRESS
0	0	8KB	0xFFE0_0000
0	1	4KB	0xFFE0_0000
1	0	4KB	0xFFE0.1000
1	1	Unavailable	

### 7.4.2 Non-Cacheable Area

Although the cache affects the entire 2GB system memory, it is sometimes necessary to define non-cacheable areas when the consistency of data stored in memory and the cache must be ensured. To support this, the W90P710 provides a non-cacheable area control bit in the address field, A[31].

If A[31] in the ROM/FLASH, SDRAM, or external I/O bank's access address is "0", then the accessed data is cacheable. If the A [31] value is "1", the accessed data is non-cacheable.

### 7.4.3 Instruction Cache

The Instruction cache (I-cache) is a 4K bytes two-way set associative cache. The cache organization is 128 sets, two lines per set, and four words per line. Cache lines are aligned on 4-word boundaries in memory. The cache access cycle begins with an instruction request from the instruction unit in the core. In the case of a cache hit, the instruction is delivered to the instruction unit. In case of a cache miss, the cache initiates a burst read cycle on the internal bus with the address of the requested instruction. The first word received from the bus is the requested instruction. The cache forwards this instruction to the instruction unit of the core as soon as it is received from the internal bus. A cache line is then selected to receive the data that will be coming from the bus. A least recently used (LRU) replacement algorithm is used to select a line when no empty lines are available. When I-Cache is disabled, the cache memory is served as 4KB On-chip RAM. The I-Cache is always disabled on reset.

The following is a list of the instruction cache features :

- 4K bytes instruction cache
- Two-way set associative
- Four words in a cache line
- LRU replacement policy
- Lockable on a per-line basis
- Critical word first, burst access

#### Instruction Cache Operation

On an instruction fetch, bits 10-4 of the instruction's address point into the cache to retrieve the tags and data of one set. The tags from both ways are then compared against bits 30-11 of the instruction's address. If a match is found and the matched entry is valid, then it is a cache hit. If neither tags match nor the matched tag is not valid, it is a cache miss.

#### Instruction Cache Hit

In case of a cache hit, bits 3-2 of the instruction address is used to select one word from the cache line whose tag matches. The instruction is immediately transferred to the instruction unit of the core.

#### Instruction Cache Miss

On an instruction cache miss, the address of the missed instruction is driven on the internal bus with a 4-word burst transfer read request. A cache line is then selected to receive the data that will be coming from the bus. The selection algorithm gives first priority to invalid lines. If neither of the two lines in the selected set is invalid, then the least recently used line is selected for replacement. Locked lines are never replaced. The transfer begins with the word requested by the instruction unit (critical word first), followed by the remaining words of the line, then by the word at the beginning of the lines (wraparound).

#### Instruction Cache Flushing

The W90P710 does not support external memory snooping. Therefore, if self-modifying code is written, the instructions in the I-Cache may become invalid. The entire I-Cache can be flushed by software in one operation, or can be flushed one line at a time by setting the **CAHCON** register bit **FLHS** or **FLHA** with the **ICAH** bit is set. As flushing the cache line, the "V" bit of the line is cleared to "0". The I-Cache is automatically flushed during reset.

## Instruction Cache Load and Lock

The W90P710 supports a cache-locking feature that can be used to lock critical sections of code into I-Cache to guarantee quick access. Lockdown can be performed with a granularity of one cache line. The smallest space, which can be locked down, is 4 words. After a line is locked, it operates as a regular instruction SRAM. Lines locked are not replaced during misses and not affected by flush per line command.

To load and lock instruction, the following sequence should be followed:

1. Write the start address of the instructions to be locked into **CAHADR** register.
2. Set **LDLK** and **ICAH** bits in the **CAHCON** register.
3. Increased the address by 16 and written into **CAHADR** register.
4. Set **LDLK** and **ICAH** bits in the **CAHCON** register.
5. Repeat the steps 3 and 4, until the desired instructions are all locked.

When using I-Cache load and lock command, there are some notes should be cared.

- The programs executing load and lock operation should be held in a non-cacheable area of memory.
- The cache should be enabled and interrupts should be disabled.
- Software must flush the cache before execute load and lock to ensure that the code to be locked down is not already in the cache.

## Instruction Cache Unlock

The unlock operation is used to unlock previously locked cache lines. After unlock, the "L" bit of the line is cleared to "0". W90P710 has two unlock command, unlock line and unlock all.

The unlock line operation is performed on a cache line granularity. In case the line is found in the cache, it is unlocked and starts to operate as a regular valid cache line. In case the line is not found in the cache, no operation is done and the command terminates with no exception. To unlock one line the following unlock line sequence should be followed:

1. Write the address of the line to be unlocked into the **CAHADR** Register.
2. Set the **ULKS** and **ICAH** bits in the **CAHCON** register.

The unlock all operation is used to unlock the whole I-Cache. This operation is performed on all cache lines. In case a line is locked, it is unlocked and starts to operate as regular valid cache line. In case a line is not locked or if it is invalid, no operation is performed. To unlock the whole cache, set the **ULKA** and **ICAH** bits.

## 7.4.4 Data Cache

The W90P710 data cache (D-Cache) is a 4KB two-way set associative cache. The cache organization is 128 sets, two lines per set, and four words per line. Cache lines are aligned on 4-word boundaries in memory. The cache is designed for **buffer write-through** mode of operation and a least recently used (LRU) replacement algorithm is used to select a line when no empty lines are available.

When D-Cache is disabled, the cache memory is served as 4KB On-chip RAM.

The D-Cache is always disabled on reset.

The following is a list of the data cache features :

- 4K bytes data cache
- Two-way set associative
- Four words in a cache line
- LRU replacement policy
- Lockable on a per-line basis
- Critical word first, burst access
- Buffer Write-through mode
- 8 words write buffer
- Drain write buffer

### Data Cache Operation

On a data fetch, bits 10-4 of the data's address point into the cache to retrieve the tags and data of one set. The tags from both ways are then compared against bits 30-11 of the data's address. If a match is found and the matched entry is valid, then it is a cache hit. If neither tags match nor the matched tag is not valid, it is a cache miss.

### Data Cache Read

**Read Hit** : On a cache hit, the requested word is immediately transferred to the core.

**Read Miss** : A line in the cache is selected to hold the data, which will be fetched from memory. The selection algorithm gives first priority to invalid lines and if both lines are invalid the line in way zero is selected first. If neither of the two candidate lines in the selected set is invalid, then one of the lines is selected by the LRU algorithm to replace. The transfer begins with the aligned word containing the missed data (critical word first), followed by the remaining word in the line, then by the word at the beginning of the line (wraparound). As the missed word is received from the bus, it is delivered directly to the core.

### Data Cache Write

As buffer write-through mode, store operations always update memory. The buffer write-through mode is used when external memory and internal cache images must always agree.

**Write Hit** : Data is written into both the cache and write buffer. The processor then continues to access the cache, while the cache controller simultaneously downloads the contents of the write buffer to main memory. This reduces the effective write memory cycle time from the time required for a main memory cycle to the cycle time of the high-speed cache.

**Write Miss** : Data is only written into write buffer, not to the cache (write no allocate).

## Data Cache Flushing

The W90P710 allows flushing of the data cache under software control. The data cache may be invalidated through writing flush line (**FLHS**) or flush all (**FLHA**) commands to the **CAHCON** register. Flushing the entire D-Cache also flushed any locked down code. As flushing the data cache, the "V" bit of the line is cleared to "0". The D-cache is automatically flushed during reset.

## Data Cache Load and Lock

The W90P710 supports a cache-locking feature that can be used to lock critical sections of data into D-Cache to guarantee quick access. Lockdown can be performed with a granularity of one cache line. The smallest space, which can be locked down, is 4 words. After a line is locked, it operates as a regular instruction SRAM. The locked lines are not replaced during misses and it is not affected by flush per line command.

To load and lock data, the following sequence should be followed:

1. Write the start address of the data to be locked into **CAHADR** register.
2. Set **LDLK** and **DCAH** bits in the **CAHCON** register.
3. Increased the address by 16 and written into **CAHADR** register.
4. Set **LDLK** and **DCAH** bits in the **CAHCON** register.
5. Repeat the steps 3 and 4, until the desired data are all locked.

When using D-Cache load and lock command, there are some notes should be cared.

- The programs executing load and lock operation should be held in a non-cacheable area of memory.
- The cache should be enabled and interrupts should be disabled.
- Software must flush the cache before execute load and lock to ensure that the data to be locked down is not already in the cache.

## Data Cache Unlock

The unlock operation is used to unlock previously locked cache lines. After unlock, the "L" bit of the line is cleared to "0". W90P710 has two unlock command, unlock line and unlock all.

The unlock line operation is performed on a cache line granularity. In case the line is found in the cache, it is unlocked and starts to operate as a regular valid cache line. In case the line is not found in the cache, no operation is done and the command terminates with no exception. To unlock one line the following unlock line sequence should be followed:

1. Write the address of the line to be unlocked into the **CAHADR** Register.
2. Set the **ULKS** and **DCAH** bits in the **CAHCON** register.

The unlock all operation is used to unlock the whole D-Cache. This operation is performed on all cache lines. In case a line is locked, it is unlocked and starts to operate as regular valid cache line. In case a line is not locked or if it is invalid, no operation is performed. To unlock the whole cache, set the **ULKA** and **DCAH** bits.

## 7.4.5 Write Buffer

The W90P710 provides a write buffer to improve system performance. The write buffer can buffer up to eight words of data. The write buffer may be enabled or be disabled via the **WRBEN** bit in the **CAHCNF** register, and the buffer is disabled and flushed on reset.

### Drain write buffer

To force data, this is in write buffer, to be written to external main memory. This operation is useful in real time applications where the processor needs to be sure that a write to a peripheral has completed before program execution continues.

To perform this command, you can set the **DRWB** and **DCAH** bits in **CAHCON** register.

## 7.4.6 Cache Control Registers Map

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
CAHCNF	0xFFFF0_2000	R/W	Cache configuration register	0x0000_0000
CAHCON	0xFFFF0_2004	R/W	Cache control register	0x0000_0000
CAHADR	0xFFFF0_2008	R/W	Cache address register	0x0000_0000
CTEST0	0xFFFF6_0000	R/W	Cache test register 0	0x0000_0000
CTEST1	0xFFFF6_0004	R	Cache test register 1	0x0000_0000

## Configuration Register (CAHCNF)

Cache controller has a configuration register to enable or disable the I-Cache, D-Cache, and Write buffer.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
CAHCNF	0xFFFF0_2000	R/W	Cache configuration register	0x0000_0000

31	30	29	28	27	26	25	24

RESERVED					WRBEN	DCAEN	ICAEN

BITS	DESCRIPTION	
[31:3]	RESERVED	-
[2]	WRBEN	<b>Write buffer enable</b> Write buffer is disabled after reset. 1 = enable write buffer 0 = disable write buffer
[1]	DCAEN	<b>D-Cache enable</b> D-Cache is disabled after reset. 1 = enable D-cache 0 = disable D-cache
[0]	ICAEN	<b>I-Cache enable</b> I-Cache is disabled after reset. 1 = enable I-cache 0 = disable I-cache

## Control Register (CAHCON)

Cache controller supports one Control register used to control the following operations.

- Flush I-Cache and D-Cache
- Load and lock I-Cache and D-Cache
- Unlock I-Cache and D-Cache
- Drain write buffer

These command set bits in **CAHCON** register are auto-clear bits. As the end of execution, that command set bit will be cleared to "0" automatically.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
CAHCON	0xFFFF0_2004	R/W	Cache control register	0x0000_0000

31	30	29	28	27	26	25	24
RESERVED							
23	22	21	20	19	18	17	16
RESERVED

RESERVED							
7	6	5	4	3	2	1	0
DRWB	ULKS	ULKA	LDLK	FLHS	FLHA	DCAH	ICAH

BITS	DESCRIPTION	
[31:8]	RESERVED	-
[7]	DRWB	<b>Drain write buffer</b> Forces write buffer data to be written to main memory.
[6]	ULKS	<b>Unlock I-Cache/D-Cache single line</b> Unlocks the I-Cache/D-Cache per line. Both <b>WAY</b> and <b>ADDR</b> bits in <b>CAHADR</b> register must be specified.
[5]	ULKA	<b>Unlock I-Cache/D-Cache entirely</b> Unlocks the entire I-Cache/D-Cache, the lock bit "L" will be cleared to 0.
[4]	LDLK	<b>Load and Lock I-Cache/D-Cache</b> Loads the instruction or data from external memory and locks into cache. Both <b>WAY</b> and <b>ADDR</b> bits in <b>CAHADR</b> register must be specified.
[3]	FLHS	<b>Flush I-Cache/D-Cache single line</b> Flushes the entire I-Cache/D-Cache per line. Both <b>WAY</b> and <b>ADDR</b> bits in <b>CAHADR</b> register must be specified.
[2]	FLHA	<b>Flush I-Cache/D-Cache entirely</b> To flush the entire I-Cache/D-Cache, also flushes any locked-down code. If the I-Cache/D-Cache contains locked down code, the programmer must flush lines individually
[1]	DCAH	<b>D-Cache selected</b> When set to "1", the command set is executed with D-Cache.
[0]	ICAH	<b>I-Cache selected</b> When set to "1", the command set is executed with I-Cache.

**NOTE** : When using the **FLHA** or **ULKA** command, you can set **both ICAH** and **DCAH** bits to execute entire I-Cache **and** D-Cache flushing or unlocking. But, **FLHS** and **ULKS** commands can only be executed with a cache line specified by **CAHADR** register in I-Cache **or** D-Cache at a time. If you set **both ICAH** and **DCAH** bits, and set **FLHS** or **ULKS** command bit, it will be treated as an invalid command and no operation is done and the command terminates with no exception.

The **Drain Write Buffer** operation is only for D-Cache. To perform this operation, you must set **DRWB** and **DCAH** bits. If the **ICAH** bit is set when using **DRWB** command, it will be an invalid command and no operation is done and the command terminates with no exception.

## Address Register (CAHADR)

W90P710 Cache Controller supports one address register. This address register is used with the command set in the control register (**CAHCON**) by specifying instruction/data address.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
CAHADR	0xFFFF0_2008	R/W	Cache address register	0x0000_0000

31	30	29	28	27	26	25	24

[0]	BFAIL0	<b>BIST test fail for instruction cache ram way 0</b> If this bit equals to “1”, it indicates the instruction cache ram for way 0 is tested fail by BIST. “0” means the test is passed.

## 7.5 Ethernet MAC Controller

### Overview

The W90P710 provides an Ethernet MAC Controller (EMC) for LAN application. This EMC has its DMA controller, transmit FIFO, and receive FIFO.

The Ethernet MAC controller consists of IEEE 802.3/Ethernet protocol engine with internal CAM function for Ethernet MAC address recognition, Transmit-FIFO, Receive-FIFO, TX/RX state machine controller and status controller. The EMC only supports RMI (Reduced MII) interface to connect with PHY operating on 50MHz REF\_CLK.

### Features

- Supports IEEE Std. 802.3 CSMA/CD protocol.
- Supports both half and full duplex for 10M/100M bps operation.
- Supports RMI interface.
- Supports MII Management function.
- Supports pause and remote pause function for flow control.
- Supports long frame (more than 1518 bytes) and short frame (less than 64 bytes) reception.
- Supports 16 entries CAM function for Ethernet MAC address recognition.
- Supports internal loop back mode for diagnostic.
- Supports 256 bytes embedded transmit and receive FIFO.
- Supports DMA function.

**7.5.1 EMC Functional Description**

**MII Management State Machine**

The MII management function of EMC is compliant to IEEE 802.3 Std. Through the MII management interface, software can access the control and status registers of the external PHY chip. Two programmable registers MIID (MAC MII Management Data Register) and MIIDA (MAC MII Management Data Control and Address Register) are for MII management function. Set the bit BUSY of MIIDA register will trigger the MII management state machine. After the MII management cycle is finished, the BUSY bit will be cleared automatically.

**Media Access Control (MAC)**

The function of W90P710 MAC fully meets the requirements defined by the IEEE802.3u specification. The following paragraphs will describe the frame structure and the operation of the transmission and receive.

The transmission data frame sent from the transmit DMA will be encapsulated by the MAC before transmitting onto the MII bus. The sent data will be assembled with the preamble, the start frame delimiter (SFD), the frame check sequence and the padding for enforcing those less than 64 bytes to meet the minimum size frame and CRC sequence. The outgoing frame format will be as following

10101010	---	10101010	10101011	d0	d1	d2	-	dn	Padding	CRC31	CRC30	---	CRC0
----------	-----	----------	----------	----	----	----	---	----	---------	-------	-------	-----	------

As mentioned by the above format, the preamble is a consecutive 7-byte long with the pattern "10101010" and the SFD is a one byte 10101011 data. The padding data will be all 0 value if the sent data frame is less than 64 bytes. The padding disable function specified in the bit P of the transmit descriptor is used to control if the MAC needs to pad data at the end of frame data or not when the transmitted data frame is less than 64 bytes. The padding data will not be appended if the padding disable bit is set to be high. The bits CRC0 ... CRC31 are the 32 bits cyclic redundancy check (CRC) sequence. The CRC encoding is defined by the following polynomial specified by the IEEE802.3. This 32 bits CRC appending function will be disabled if the Inhibit CRC of the transmission descriptor is set to high.

The MAC also performs many other transmission functions specified by the IEEE802.3, including the inter-frame spacing function, collision detection, collision enforcement, collision back off and retransmission. The collision back-off timer is a function of the integer slot time, 512 bit times. The number of slot times to delay between the current transmissions attempts to the next attempt is determined by a uniformly distributed random integer algorithm specified by the IEEE802.3. The MAC performs the receive functions specified by the IEEE 802.3 including the address recognition function, the frame check sequence validation, the frame disassembly, framing and collision filtering.

## EMC Descriptors

A link-list data structure named as descriptor is used to keep the control, status and data information of each frame. Through the descriptor, CPU and EMC exchange the information for frame reception and transmission.

Two different descriptors are defined in W90P710. One named as Rx descriptor for frame reception and the other names as Tx descriptor for frame transmission. Each Rx descriptor consists of four words. There is much information kept in the descriptors and details are described as below.

### 7.5.1.1. Rx Buffer Descriptor

3	3	2	1	1	0
1	0	9	6	5	
O	Rx Status			Receive Byte Count	
Receive Buffer Starting Address					BO
Reserved					
Next Rx Descriptor Starting Address					

### Rx Descriptor Word 0

31	30	29	28	27	26	25	24
Owner		Reserved					
23	22	21	20	19	18	17	16
Reserved	RP	ALIE	RXGD	PTLE	Reserved	CRCE	RXINTR
15	14	13	12	11	10	9	8
RBC							
7	6	5	4	3	2	1	0
RBC							

#### Owner [31:30]: Ownership

The ownership field defines which one, the CPU or EMC, is the owner of each Rx descriptor. Only the owner has right to modify the Rx descriptor and the others can read the Rx descriptor only.

00: The owner is CPU

01: Undefined

10: The owner is EMC

11: Undefined

If the O=2'b10 indicates the EMC RxDMA is the owner of Rx descriptor and the Rx descriptor is available for frame reception. After the frame reception completed, if the frame needed NAT translation, EMC RxDMA modify ownership field to 2'b11. Otherwise, the ownership field will be modified to 2'b00.

If the O=2'b00 indicates the CPU is the owner of Rx descriptor. After the CPU completes processing the frame, it modifies the ownership field to 2'b10 and releases the Rx descriptor to EMC RxDMA.

## **Rx Status [29:16]: Receive Status**

This field keeps the status for frame reception. All status bits are updated by EMC. In the receive status, bits 29 to 23 are undefined and reserved for the future.

## **RP [22]: Runt Packet**

The RP indicates the frame stored in the data buffer pointed by Rx descriptor is a short frame (frame length is less than 64 bytes).

1'b0: The frame is not a short frame.

1'b1: The frame is a short frame.

## **ALIE [21]: Alignment Error**

The ALIE indicates the frame stored in the data buffer pointed by Rx descriptor is not a multiple of byte.

1'b0: The frame is a multiple of byte.

1'b1: The frame is not a multiple of byte.

## **RXGD [20]: Frame Reception Complete**

The RXGD indicates the frame reception has completed and stored in the data buffer pointed by Rx descriptor.

1'b0: The frame reception not complete yet.

1'b1: The frame reception completed.

## **PTLE [19]: Packet Too Long**

The PTLE indicates the frame stored in the data buffer pointed by Rx descriptor is a long frame (frame length is greater than 1518 bytes).

1'b0: The frame is not a long frame.

1'b1: The frame is a long frame.

## **CRCE [17]: CRC Error**

The CRCE indicates the frame stored in the data buffer pointed by Rx descriptor incurred CRC error.

1'b0: The frame doesn't incur CRC error.

1'b1: The frame incurred CRC error.

## RXINTR [16]: Receive Interrupt

The RXINTR indicates the frame stored in the data buffer pointed by Rx descriptor caused an interrupt condition.

1'b0: The frame doesn't cause an interrupt.

1'b1: The frame caused an interrupt.

## RBC [15:0]: Receive Byte Count

The RBC indicates the byte count of the frame stored in the data buffer pointed by Rx descriptor. The four bytes CRC field is also included in the receive byte count. But if the SPCRC of register MCMDR is enabled, the four bytes CRC field will be excluded from the receive byte count.

## Rx Descriptor Word 1

31	30	29	28	27	26	25	24
RXBSA							
23	22	21	20	19	18	17	16
RXBSA							
15	14	13	12	11	10	9	8
RXBSA							
7	6	5	4	3	2	1	0
RXBSA						BO	

## RXBSA [31:2]: Receive Buffer Starting Address

The RXBSA indicates the starting address of the receive frame buffer. The RXBSA is used to be the bit 31 to 2 of memory address. In other words, the starting address of the receive frame buffer always located at word boundary.

## BO [1:0]: Byte Offset

The BO indicates the byte offset from RXBSA where the received frame begins to store. If the BO is 2'b01, the starting address where the received frame begins to store is RXBSA+2'b01, and so on.

**Rx Descriptor Word 2**

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							

The Rx descriptor word 2 keeps obsolete information for MAC translation. Therefore, these information bits are undefined and should be ignored.

**Rx Descriptor Word 3**

31	30	29	28	27	26	25	24
NRXDSA							
23	22	21	20	19	18	17	16
NRXDSA							
15	14	13	12	11	10	9	8
NRXDSA							
7	6	5	4	3	2	1	0
NRXDSA							

**NRXDSA [31:0]: Next Rx Descriptor Starting Address**

The Rx descriptor is a link-list data structure. Consequently, NRXDSA is used to keep the starting address of the next Rx descriptor. The bits [1:0] will be ignored by EMC. So, all Rx descriptor must locate at word boundary memory address.

7.5.1.2. Tx Buffer Descriptor

3	3	1	1	3	2	1	0		
1	0	6	5						
O	Reserved						I	C	P
Transmit Buffer Starting Address								BO	
Tx Status				Transmit Byte Count					
Next Tx Descriptor Starting Address									

Tx Descriptor Word 0

31	30	29	28	27	26	25	24
Owner		Reserved					
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					IntEn	CRCApp	PadEn

**Owner [31]: Ownership**

The ownership field defines which one, the CPU or EMC, is the owner of each Tx descriptor. Only the owner has right to modify the Tx descriptor and the other can read the Tx descriptor only.

- 0: The owner is CPU
- 1: The owner is EMC

If the O=1'b1 indicates the EMC TxDMA is the owner of Tx descriptor and the Tx descriptor is available for frame transmission. After the frame transmission completed, EMC TxDMA modify ownership field to 1'b0 and return the ownership of Tx descriptor to CPU.

If the O=1'b0 indicates the CPU is the owner of Tx descriptor. After the CPU prepares new frame to wait transmission, it modifies the ownership field to 1'b1 and releases the Tx descriptor to EMC TxDMA.

**IntEn [2]: Transmit Interrupt Enable**

The IntEn controls the interrupt trigger circuit after the frame transmission completed. If the IntEn is enabled, the EMC will trigger interrupt after frame transmission completed. Otherwise, the interrupt doesn't be triggered.

- 1'b0: Frame transmission interrupt is masked.
- 1'b1: Frame transmission interrupt is enabled.

### CRCApp [1]: CRC Append

The CRCApp control the CRC append during frame transmission. If CRCApp is enabled, the 4-bytes CRC checksum will be appended to frame at the end of frame transmission.

1'b0: 4-bytes CRC appending is disabled.

1'b1: 4-bytes CRC appending is enabled.

### PadEN [0]: Padding Enable

The PadEN control the PAD bits appending while the length of transmission frame is less than 60 bytes. If PadEN is enabled, EMC does the padding automatically.

1'b0: PAD bits appending is disabled.

1'b1: PAD bits appending is enabled.

### Tx Descriptor Word 1

31	30	29	28	27	26	25	24
TXBSA							
23	22	21	20	19	18	17	16
TXBSA							
15	14	13	12	11	10	9	8
TXBSA							
7	6	5	4	3	2	1	0
TXBSA						BO	

### TXBSA [31:2]: Transmit Buffer Starting Address

The TXBSA indicates the starting address of the transmit frame buffer. The TXBSA is used to be the bit 31 to 2 of memory address. In other words, the starting address of the transmit frame buffer always located at word boundary.

### BO [1:0]: Byte Offset

The BO indicates the byte offset from TXBSA where the transmit frame begins to read. If the BO is 2'b01, the starting address where the transmit frame begins to read is TXBSA+2'b01, and so on.

## Tx Descriptor Word 2

31	30	29	28	27	26	25	24
CCNT				Reserved	SQE	PAU	TXHA
23	22	21	20	19	18	17	16
LC	TXABT	NCS	EXDEF	TXCP	Reserved	DEF	TXINTR
15	14	13	12	11	10	9	8
TBC							
7	6	5	4	3	2	1	0
TBC							

### CCNT [31:28]: Collision Count

The CCNT indicates the how many collision occurred consecutively during a packet transmission. If the packet incurred 16 consecutive collisions during transmission, the CCNT will be 4'h0 and bit TXABT will be set to 1.

### SQE [26]: SQE Error

The SQE indicates the SQE error found at end of packet transmission on 10Mbps half-duplex mode. The SQE error check will only be done while both bit EnSQE of MCMMDR is enabled and EMC is operating on 10Mbps half-duplex mode.

1'b0: No SQE error found at end of packet transmission.

1'b1: SQE error found at end of packet transmission.

### PAU [25]: Transmission Paused

THE PAU INDICATES THE NEXT NORMAL PACKET transmission process will be paused temporarily because EMC received a PAUSE control frame, or S/W set bit SDPZ of MCMMDR and make EMC to transmit a PAUSE control frame out.

1'b0: Next normal packet transmission process will go on.

1'b1: Next normal packet transmission process will be paused.

### TXHA [24]: Transmission Halted

The TXHA indicates the next normal packet transmission process will be halted because the bit TXON of MCMMDR is disabled by S/W.

1'b0: Next normal packet transmission process will go on.

1'b1: Next normal packet transmission process will be halted.

## **LC [23]: Late Collision**

The LC indicates the collision occurred in the outside of 64 bytes collision window. This means after the 64 bytes of a frame has transmitted out to the network, the collision still occurred. The late collision check will only be done while EMC is operating on half-duplex mode.

1'b0: No collision occurred in the outside of 64 bytes collision window.

1'b1: Collision occurred in the outside of 64 bytes collision window.

## **TXABT [22]: Transmission Abort**

The TXABT indicates the packet incurred 16 consecutive collisions during transmission, and then the transmission process for this packet is aborted. The transmission abort is only available while EMC is operating on half-duplex mode.

1'b0: Packet doesn't incur 16 consecutive collisions during transmission.

1'b1: Packet incurred 16 consecutive collisions during transmission.

## **NCS [21]: No Carrier Sense**

The NCS indicates the MII I/F signal CRS doesn't active at the start of or during the packet transmission. The NCS is only available while EMC is operating on half-duplex mode.

1'b0: CRS signal actives correctly.

1'b1: CRS signal doesn't active at the start of or during the packet transmission.

## **EXDEF [20]: Defer Exceed**

The EXDEF indicates the frame waiting for transmission has deferred over 0.32768ms on 100Mbps mode, or 3.2768ms on 10Mbps mode. The deferral exceed check will only be done while bit NDEF of MCMADR is disabled, and EMC is operating on half-duplex mode.

1'b0: Frame waiting for transmission has not deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).

1'b1: Frame waiting for transmission has deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).

## **TXCP [19]: Transmission Complete**

The TXCP indicates the packet transmission has completed correctly.

1'b0: The packet transmission doesn't complete.

1'b1: The packet transmission has completed.

## **DEF [17]: Transmission Deferred**

The DEF indicates the packet transmission has deferred once. The DEF is only available while EMC is operating on half-duplex mode.

1'b0: Packet transmission doesn't defer.

1'b1: Packet transmission has deferred once.

**TXINTR [16]: Transmit Interrupt**

The TXINTR indicates the packet transmission caused an interrupt condition.

1'b0: The packet transmission doesn't cause an interrupt.

1'b1: The packet transmission caused an interrupt.

**TBC [15:0]: Transmit Byte Count**

The TBC indicates the byte count of the frame stored in the data buffer pointed by Tx descriptor for transmission.

**Tx Descriptor Word 3**

31	30	29	28	27	26	25	24
NTXDSA							
23	22	21	20	19	18	17	16
NTXDSA							
15	14	13	12	11	10	9	8
NTXDSA							
7	6	5	4	3	2	1	0
NTXDSA							

**NTXDSA [31:0]: Next Tx Descriptor Starting Address**

The Tx descriptor is a link-list data structure. Consequently, NTXDSA is used to keep the starting address of the next Tx descriptor. The bits [1:0] will be ignored by EMC. So, all Tx descriptor must locate at word boundary memory address.

## 7.5.2 EMC Register Mapping

The EMC implements many registers and the registers are separated into three types, the control registers, the status registers and diagnostic registers. The control registers are used by S/W to pass control information to EMC. The status registers are used to keep EMC operation status for S/W. And, the diagnostic registers are used for debug only.

### EMC Registers

### 7.5.2.1. Register Details

#### CAM Command Register (CAMCMR)

The EMC of W90P710 supports CAM function for destination MAC address recognition. The CAMCMR control the CAM comparison function, and unicast, multicast, and broadcast packet reception.

Register	Address	R/W	Description	Reset Value
CAMCMR	0xFFFF0_3000	R/W	CAM Command Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved			ECMP	CCAM	ABP	AMP	AUP

BITS	DESCRIPTIONS	
[31:5]	Reserved	-
[4]	ECMP	<p>The <b>ECMP(Enable CAM Compare)</b> controls the enable of CAM comparison function for destination MAC address recognition. If S/W wants to receive a packet with specific destination MAC address, configures the MAC address into anyone of 16 CAM entries, then enables that CAM entry and set ECMP to 1.</p> <p>1'b0: Disable CAM comparison function for destination MAC address recognition.</p> <p>1'b1: Enable CAM comparison function for destination MAC address recognition.</p>
[3]	CCAM	<p>The <b>CCAM(Complement CAM Compare)</b> controls the complement of the CAM comparison result. If the ECMP and CCAM are both enabled, the incoming packet with specific destination MAC address configured in CAM entry will be dropped. And the incoming packet with destination MAC address doesn't configured in any CAM entry will be received.</p> <p>1'b0: The CAM comparison result doesn't be complemented.</p> <p>1'b1: The CAM comparison result will be complemented.</p>

Continued.

BITS	DESCRIPTIONS	
[2]	ABP	<p>The <b>Accept Broadcast Packet</b> controls the broadcast packet reception. If ABP is enabled, EMC receives all incoming packet it's destination MAC address is a broadcast address.</p> <p>1'b0: EMC receives packet depends on the CAM comparison result.</p> <p>1'b1: EMC receives all broadcast packets.</p>
[1]	AMP	<p>The <b>Accept Multicast Packet</b> controls the multicast packet reception. If AMP is enabled, EMC receives all incoming packet it's destination MAC address is a multicast address.</p> <p>1'b0: EMC receives packet depends on the CAM comparison result.</p> <p>1'b1: EMC receives all multicast packets.</p>
[0]	AUP	<p>The <b>Accept Unicast Packet</b> controls the unicast packet reception. If AUP is enabled, EMC receives all incoming packet it's destination MAC address is a unicast address.</p> <p>1'b0: EMC receives packet depends on the CAM comparison result.</p> <p>1'b1: EMC receives all unicast packets.</p>

<b>CAMCMR Setting and Comparison Result</b>
<p><b>CAMCMR Setting and Comparison Result</b></p> <p>The following table is the address recognition result in different CAMCMR configuration. The column Result shows the incoming packet type that can pass the address recognition in specific CAM configuration. The C, U, M and B represents the:</p> <p><b>C:</b> It indicates the destination MAC address of incoming packet has been configured in CAM entry.</p> <p><b>U:</b> It indicates the incoming packet is a unicast packet.</p> <p><b>M:</b> It indicates the incoming packet is a multicast packet.</p> <p><b>B:</b> It indicates the incoming packet is a broadcast packet.</p>

BITS	DESCRIPTIONS	
[31:16]	Operand	Pause Parameter, In the PAUSE control frame, an operand field is defined and controls how much time the destination Ethernet MAC Controller is paused. The unit of the operand is the slot time, the 512 bits time.
[15:0]		Reserved

**Transmit Descriptor Link List Start Address Register (TXDLSA)**

The Tx descriptor defined in EMC is a link-list data structure. The TXDLSA keeps the starting address of this link-list. In other words, the TXDLSA keeps the starting address of the 1<sup>st</sup> Tx descriptor. S/W must configure TXDLSA before enable bit TXON of MCMDR register.

Register	Address	R/W	Description	Reset Value
TXDLSA	0xFFFF0_3088	R/W	Transmit Descriptor Link List Start Address Register	0xFFFF_FFFC

31	30	29	28	27	26	25	24
TXDLSA							
23	22	21	20	19	18	17	16
TXDLSA							
15	14	13	12	11	10	9	8
TXDLSA							
7	6	5	4	3	2	1	0
TXDLSA							

BITS	DESCRIPTIONS	
[31:0]	TXDLSA	The <b>TXDLSA(Transmit Descriptor Link-List Start Address)</b> keeps the start address of transmit descriptor link-list. If the S/W enables the bit TXON of MCMDR register, the content of TXDLSA will be loaded into the current transmit descriptor start address register (CTXDSA). The TXDLSA doesn't be updated by EMC. During the operation, EMC will ignore the bits [1:0] of TXDLSA. This means that each Tx descriptor always must locate at word boundary memory address.

**Receive Descriptor Link List Start Address Register (RXDLSA)**

The Rx descriptor defined in EMC is a link-list data structure. The RXDLSA keeps the starting address of this link-list. In other words, the RXDLSA keeps the starting address of the 1<sup>st</sup> Rx descriptor. S/W must configure RXDLSA before enable bit RXON of MCMDR register.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
RXDLSA	0xFFFF0_308C	R/W	Receive Descriptor Link List Start Address Register	0xFFFF_FFFC

31	30	29	28	27	26	25	24
RXDLSA							
23	22	21	20	19	18	17	16
RXDLSA							
15	14	13	12	11	10	9	8
RXDLSA							
7	6	5	4	3	2	1	0
RXDLSA							

BITS	DESCRIPTIONS	
[31:0]	RXDLSA	The <b>RXDLSA(Receive Descriptor Link-List Start Address)</b> keeps the start address of receive descriptor link-list. If the S/W enables the bit RXON of MCMDR register, the content of RXDLSA will be loaded into the current receive descriptor start address register (CRXDLSA). The RXDLSA doesn't be updated by EMC. During the operation, EMC will ignore the bits [1:0] of RXDLSA. This means that each Rx descriptor always must locate at word boundary memory address.

### MAC Command Register (MCMDR)

The MCMDR provides the control information for EMC. Some command settings affect both frame transmission and reception, such as bit FDUP, the full/half duplex mode selection, or bit OPMOD, the 100/10M bps mode selection. Some command settings control frame transmission and reception separately, likes bit TXON and RXON.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MCMDR	0xFFFF0_3090	R/W	MAC Command Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							SWR
23	22	21	20	19	18	17	16
Reserved		LBK	OPMOD	EnMDC	FDUP	EnSQE	SDPZ
15	14	13	12	11	10	9	8
Reserved						NDEF	TXON
7	6	5	4	3	2	1	0
Reserved		SPCRC	AEP	ACP	ARP	ALP	RXON

BITS	DESCRIPTIONS	
[31:25]	Reserved	-
[24]	SWR	<p>The <b>SWR (Software Reset)</b> implements a reset function to make the EMC return default state. The SWR is a self-clear bit. This means after the software reset finished, the SWR will be cleared automatically. Enable SWR can also reset all control and status registers, except for OPMOD bit of MCMDR register.</p> <p>The EMC re-initial is needed after the software reset completed.</p> <p>1'b0: Software reset completed. 1'b1: Enable software reset.</p>
[23:22]	Reserved	-
[21]	LBK	<p>The <b>LBK (Internal Loop Back Select)</b> enables the EMC operating on internal loop-back mode. If the LBK is enabled, the packet transmitted out will be loop-backed to Rx. If the EMC is operating on internal loop-back mode, it also means the EMC is operating on full-duplex mode and the value of FDUP of MCMDR register is ignored. Beside, the LBK doesn't be affected by SWR bit.</p> <p>1'b0: The EMC operates in normal mode. 1'b1: The EMC operates in internal loop-back mode.</p>
[20]	OPMOD	<p>The <b>Operation Mode Select</b> defines the EMC is operating on 10M or 100M bps mode. The OPMOD doesn't be affected by SWR bit.</p> <p>1'b0: The EMC operates on 10Mbps mode. 1'b1: The EMC operates on 100Mbps mode.</p>
[19]	EnMDC	<p>The <b>Enable MDC Clock Generation</b> controls the MDC clock generation for MII Management Interface. If the EnMDC is set to 1, the MDC clock generation is enabled. Otherwise, the MDC clock generation is disabled. Consequently, if S/W wants to access the registers of external PHY through MII Management Interface, the EnMDC must be set to high.</p> <p>1'b0: Disable MDC clock generation. 1'b1: Enable MDC clock generation.</p>
[18]	FDUP	<p>The <b>Full Duplex Mode Select</b> controls that EMC is operating on full or half duplex mode.</p> <p>1'b0: The EMC operates on half duplex mode. 1'b1: The EMC operates on full duplex mode.</p>

Continued.

BITS	DESCRIPTIONS	
[17]	EnSQE	<p>The <b>Enable SQE Checking</b> controls the enable of SQE checking. The SQE checking is only available while EMC is operating on 10M bps and half duplex mode. In other words, the EnSQE cannot affect EMC operation, if the EMC is operating on 100M bps or full duplex mode.</p> <p>1'b0: Disable SQE checking while EMC is operating on 10Mbps and half duplex mode.</p> <p>1'b1: Enable SQE checking while EMC is operating on 10Mbps and half duplex mode.</p>
[16]	SDPZ	<p>The <b>Send PAUSE Frame</b> controls the PAUSE control frame transmission.</p> <p>If S/W wants to send a PAUSE control frame out, the CAM entry 13, 14 and 15 must be configured first and the corresponding CAM enable bit of CAMEN register also must be set. Then, set SDPZ to 1 enables the PAUSE control frame transmission.</p> <p>The SDPZ is a self-clear bit. This means after the PAUSE control frame transmission has completed, the SDPZ will be cleared automatically.</p> <p>It is recommended that only enables SPDZ while EMC is operating on full duplex mode.</p> <p>1'b0: The PAUSE control frame transmission has completed.</p> <p>1'b1: Enable EMC to transmit a PAUSE control frame out.</p>
[15:10]	Reserved	-
[9]	NDEF	<p>The <b>No Defer</b> controls the enable of deferral exceed counter. If NDEF is set to high, the deferral exceed counter is disabled. The NDEF is only useful while EMC is operating on half duplex mode.</p> <p>1'b0: The deferral exceed counter is enabled.</p> <p>1'b1: The deferral exceed counter is disabled.</p>

Continued.

BITS	DESCRIPTIONS	
[8]	TXON	<p>The Frame Transmission ON controls the normal packet transmission of EMC. If the TXON is set to high, the EMC starts the packet transmission process, including the Tx descriptor fetching, packet transmission and Tx descriptor modification.</p> <p>It is must to finish EMC initial sequence before enable TXON. Otherwise, the EMC operation is undefined.</p> <p>If the TXON is disabled during EMC is transmitting a packet out, the EMC stops the packet transmission process after the current packet transmission finished.</p> <p>1'b0: The EMC stops packet transmission process. 1'b1: The EMC starts packet transmission process.</p>
[7:6]	Reserved	-
[5]	SPCRC	<p>The Strip CRC Checksum controls if the length of incoming packet is calculated with 4 bytes CRC checksum. If the SPCRC is set to high, 4 bytes CRC checksum is excluded from length calculation of incoming packet.</p> <p>1'b0: The 4 bytes CRC checksum is included in packet length calculation. 1'b1: The 4 bytes CRC checksum is excluded in packet length calculation.</p>
[4]	AEP	<p>The Accept CRC Error Packet controls the EMC accepts or drops the CRC error packet. If the AEP is set to high, the incoming packet with CRC error will be received by EMC as a good packet.</p> <p>1'b0: The CRC error packet will be dropped by EMC. 1'b1: The CRC error packet will be accepted by EMC.</p>
[3]	ACP	<p>The Accept Control Packet controls the control frame reception. If the ACP is set to high, the EMC will accept the control frame. Otherwise, the control frame will be dropped.</p> <p>It is recommended that S/W only enable AEP while EMC is operating on full duplex mode.</p> <p>1'b0: The control frame will be dropped by EMC. 1'b1: The control frame will be accepted by EMC.</p>

Continued.

BITS	DESCRIPTIONS	
[2]	ARP	<p>The Accept Runt Packet controls the runt packet, which length is less than 64 bytes, reception. If the ARP is set to high, the EMC will accept the runt packet.</p> <p>Otherwise, the runt packet will be dropped.</p> <p>1'b0: The runt packet will be dropped by EMC.</p> <p>1'b1: The runt packet will be accepted by EMC.</p>
[1]	ALP	<p>The Accept Long Packet controls the long packet, which packet length is greater than 1518 bytes, reception. If the ALP is set to high, the EMC will accept the long packet.</p> <p>Otherwise, the long packet will be dropped.</p> <p>1'b0: The long packet will be dropped by EMC.</p> <p>1'b1: The long packet will be accepted by EMC.</p>
[0]	RXON	<p>The Frame Reception ON controls the normal packet reception of EMC. If the RXON is set to high, the EMC starts the packet reception process, including the Rx descriptor fetching, packet reception and Rx descriptor modification.</p> <p>It is must to finish EMC initial sequence before enable RXON. Otherwise, the EMC operation is undefined.</p> <p>If the RXON is disabled during EMC is receiving an incoming packet, the EMC stops the packet reception process after the current packet reception finished.</p> <p>1'b0: The EMC stops packet reception process.</p> <p>1'b1: The EMC starts packet reception process.</p>

### MII Management Data Register (MIID)

The EMC provides MII management function to access the control and status registers of the external PHY. The MIID register is used to store the data that will be written into the registers of external PHY for write command or the data that is read from the registers of external PHY for read command.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MIID	0xFFFF0_3094	R/W	MII Management Data Register	0x0000_0000

31	30	29	28	27	26	25	24

7	6	5	4	3	2	1	0
Reserved				PHYRAD			

BITS	DESCRIPTIONS	
[31:24]	Reserved	-
[23:20]	MDCCR	<p>The MDC Clock Rating controls the MDC clock rating for MII Management I/F.</p> <p>Depend on the IEEE Std. 802.3 clause 22.2.2.11, the minimum period for MDC shall be 400ns. In other words, the maximum frequency for MDC is 2.5MHz. The MDC is divided from the AHB bus clock, the HCLK. Consequently, for different HCLKs the different ratios are required to generate appropriate MDC clock.</p> <p>The following table shows relationship between HCLK and MDC clock in different MDCCR configurations. The <math>T_{HCLK}</math> indicates the period of HCLK.</p>
[19]	MDC	<p>The MDC Clock ON Always controls the MDC clock generation. If the MDCON is set to high, the MDC clock actives always. Otherwise, the MDC will only active while S/W issues a MII management command.</p> <p>1'b0: The MDC clock will only active while S/W issues a MII management command.</p> <p>1'b1: The MDC clock actives always.</p>
[18]	PreSP	<p>The Preamble Suppress controls the preamble field generation of MII management frame. If the PreSP is set to high, the preamble field generation of MII management frame is skipped.</p> <p>1'b0: Preamble field generation of MII management frame is not skipped.</p> <p>1'b1: Preamble field generation of MII management frame is skipped.</p>
[17]	BUSY	<p>The Busy Bit controls the enable of the MII management frame generation. If S/W wants to access registers of external PHY, it set BUSY to high and EMC generates the MII management frame to external PHY through MII Management I/F.</p> <p>The BUSY is a self-clear bit. This means the BUSY will be cleared automatically after the MII management command finished.</p> <p>1'b0: The MII management has finished.</p> <p>1'b1: Enable EMC to generate a MII management command to external PHY.</p>
[16]	Write	<p>The Write Command defines the MII management command is a read or write.</p> <p>1'b0: The MII management command is a read command.</p> <p>1'b1: The MII management command is a write command.</p>
[15:13]		Reserved

**MII Management Function Frame Format**

In IEEE Std. 802.3 clause 22.2.4, the MII management function is defined. The MII management function is used for the purpose of controlling the PHY and gathering status from the PHY. The MII management frame format is shown as follow.

Management frame fields								
	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
READ	1...1	01	10	AAAAA	RRRRR	Z0	DDDDDDDDDDDDDDDDDD	Z
WRITE	1...1	01	01	AAAAA	RRRRR	10	DDDDDDDDDDDDDDDDDD	Z

**MII Management Function Configure Sequence**

READ	WRITE
1. Set appropriate MDCCR.	1. Write data to MIID register
2. Set PHYAD and PHYRAD.	2. Set appropriate MDCCR.
3. Set Write to 1'b0	3. Set PHYAD and PHYRAD.
4. Set bit BUSY to 1'b1 to send a MII management frame out.	4. Set Write to 1'b1
5. Wait BUSY to become 1'b0.	5. Set bit BUSY to 1'b1 to send a MII management frame out.
6. Read data from MIID register.	6. Wait BUSY to become 1'b0.
7. Finish the read command.	7. Finish the write command.

**FIFO Threshold Control Register (FFTCR)**

The FFTCR defines the high and low threshold of internal FIFOs, including TxFIFO and Rx FIFO. The threshold of internal FIFOs is related to EMC request generation and when the frame transmission starts. The FFTCR also defines the burst length of AHB bus cycle for system memory access.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE

[19:10]	Reserved	-
[9:8]	TxTHD	<p>The <b>TxFIFO Low Threshold</b> controls when TxDMA requests internal arbiter for data transfer between system memory and TxFIFO. The TxTHD defines not only the low threshold of TxFIFO, but also the high threshold. The high threshold is the twice of low threshold always. During the packet transmission, if the TxFIFO reaches the high threshold, the TxDMA stops generate request to transfer frame data from system memory to TxFIFO. If the frame data in TxFIFO is less than low threshold, TxDMA starts to transfer frame data from system memory to TxFIFO.</p> <p>The TxTHD also defines when the TxMAC starts to transmit frame out to network. The TxMAC starts to transmit the frame out while the TxFIFO first time reaches the high threshold during the transmission of the frame. If the frame data length is less than TxFIFO high threshold, the TxMAC starts to transmit the frame out after the frame data are all inside the TxFIFO.</p> <p>2'b00: Undefined.            2'b01: TxFIFO low threshold is 64B and high threshold is 128B.            2'b10: TxFIFO low threshold is 80B and high threshold is 160B.            2'b11: TxFIFO low threshold is 96B and high threshold is 192B.</p>
[7:2]		Reserved
[1:0]	RxTHD	<p>The <b>RxFIFO High Threshold</b> controls when RxDMA requests internal arbiter for data transfer between RxFIFO and system memory. The RxTHD defines not only the high threshold of RxFIFO, but also the low threshold. The low threshold is the half of high threshold always. During the packet reception, if the RxFIFO reaches the high threshold, the RxDMA starts to transfer frame data from RxFIFO to system memory. If the frame data in RxFIFO is less than low threshold, RxDMA stops to transfer the frame data to system memory.</p> <p>2'b00: Depend on the burst length setting. If the burst length is 8 words, high threshold is 8 words, too.            2'b01: RxFIFO high threshold is 64B and low threshold is 32B.            2'b10: RxFIFO high threshold is 128B and low threshold is 64B.            2'b11: RxFIFO high threshold is 192B and low threshold is 96B.</p>

### Transmit Start Demand Register (TSDR)

If the Tx descriptor is not available for use of TxDMA after the TXON of MCMDR register is enabled, the FSM (Finite State Machine) of TxDMA enters the Halt state and the frame transmission is halted. After the S/W has prepared the new Tx descriptor for frame transmission, it must issue a write command to TSDR register to make TxDMA leave Halt state and contiguous frame transmission. The TSDR is a write only register and read from this register is undefined. The write to TSDR register has took effect only while TxDMA stayed at Halt state.

Register	Address	R/W	Description	Reset Value
TSDR	0xFFFF0_30A0	W	Transmit Start Demand Register	Undefined

BITS	DESCRIPTIONS	
[31:0]	Reserved	-

### Receive Start Demand Register (RSDR)

If the Rx descriptor is not available for use of RxDMA after the RXON of MCMDR register is enabled, the FSM (Finite State Machine) of RxDMA enters the Halt state and the frame reception is halted. After the S/W has prepared the new Rx descriptor for frame reception, it must issue a write command to RSDR register to make RxDMA leave Halt state and contiguous frame reception. The RSDR is a write only register and read from this register is undefined. The write to RSDR register has took effect only while RxDMA stayed at Halt state.

[24]	TxBErr	<p>The <b>Transmit Bus Error Interrupt</b> high indicates the memory controller replies ERROR response while EMC access system memory through TxDMA during packet transmission process. Reset EMC is recommended while TxBErr status is high.</p> <p>If the TxBErr is high and EnTxBErr of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TxBErr status.</p> <p>1'b0: No ERROR response is received. 1'b1: ERROR response is received.</p>
[23]	TDU	<p>The <b>Transmit Descriptor Unavailable Interrupt</b> high indicates that there is no available Tx descriptor for packet transmission and TxDMA will stay at Halt state. Once, the TxDMA enters the Halt state, S/W must issues a write command to TSDR register to make TxDMA leave Halt state while new Tx descriptor is available.</p> <p>If the TDU is high and EnTDU of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TDU status.</p> <p>1'b0: Tx descriptor is available. 1'b1: Tx descriptor is unavailable.</p>
[22]	LC	<p>The <b>Late Collision Interrupt</b> high indicates the collision occurred in the outside of 64 bytes collision window. This means after the 64 bytes of a frame has transmitted out to the network, the collision still occurred. The late collision check will only be done while EMC is operating on half-duplex mode.</p> <p>If the LC is high and EnLC of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the LC status.</p> <p>1'b0: No collision occurred in the outside of 64 bytes collision window. 1'b1: Collision occurred in the outside of 64 bytes collision window.</p>

Continued.

BITS	DESCRIPTIONS	
[21]	TXABT	<p>The <b>Transmit Abort Interrupt</b> high indicates the packet incurred 16 consecutive collisions during transmission, and then the transmission process for this packet is aborted. The transmission abort is only available while EMC is operating on half-duplex mode.</p> <p>If the TXABT is high and EnTXABT of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TXABT status.</p> <p>1'b0: Packet doesn't incur 16 consecutive collisions during transmission.</p> <p>1'b1: Packet incurred 16 consecutive collisions during transmission.</p>
[20]	NCS	<p>The <b>No Carrier Sense Interrupt</b> high indicates the MII I/F signal CRS doesn't active at the start of or during the packet transmission. The NCS is only available while EMC is operating on half-duplex mode.</p> <p>If the NCS is high and EnNCS of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the NCS status.</p> <p>1'b0: CRS signal actives correctly.</p> <p>1'b1: CRS signal doesn't active at the start of or during the packet transmission.</p>
[19]	EXDEF	<p>The <b>Defer Exceed Interrupt</b> high indicates the frame waiting for transmission has deferred over 0.32768ms on 100Mbps mode, or 3.2768ms on 10Mbps mode. The deferral exceed check will only be done while bit NDEF of MCMDR is disabled, and EMC is operating on half-duplex mode.</p> <p>If the EXDEF is high and EnEXDEF of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the EXDEF status.</p> <p>1'b0: Frame waiting for transmission has not deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).</p> <p>1'b1: Frame waiting for transmission has deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).</p>

Continued.

BITS	DESCRIPTIONS	
[18]	TXCP	<p>The <b>Transmit Completion Interrupt</b> indicates the packet transmission has completed correctly.</p> <p>If the TXCP is high and EnTXCP of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TXCP status.</p> <p>1'b0: The packet transmission doesn't complete. 1'b1: The packet transmission has completed.</p>
[17]	TXEMP	<p>The <b>Transmit FIFO Underflow Interrupt</b> high indicates the TxFIFO underflow occurred during packet transmission. While the TxFIFO underflow occurred, the EMC will retransmit the packet automatically without S/W intervention. If the TxFIFO underflow occurred often, it is recommended that modify TxTHD of FFTCR register, to higher level.</p> <p>If the TXEMP is high and EnTXEMP of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TXEMP status.</p> <p>1'b0: No TxFIFO underflow occurred during packet transmission. 1'b1: TxFIFO underflow occurred during packet transmission.</p>
[16]	TXINTR	<p>The Transmit Interrupt indicates the Tx interrupt status.</p> <p>If TXINTR high and its corresponding enable bit, EnTXINTR of MISTA register, is also high indicates the EMC generates Tx interrupt to CPU. If TXINTR is high but EnTXINTR of MISTA is disabled, no Tx interrupt is generated.</p> <p>The TXINTR is logic OR result of the bits 17~24 in MISTA register do logic AND with the corresponding bits in MIEN register. In other words, if one of the bits 17~24 in MISTA register is high and its corresponding enable bit in MIEN register is also enabled, the TXINTR will be high. Because the TXINTR is a logic OR result, clears bits 17~24 of MISTA register makes TXINTR be cleared, too.</p> <p>1'b0: No status of bits 17~24 in MISTA is set or no enable of bits 17~24 in MIEN is turned on. 1'b1: At least one status of bits 17~24 in MISTA is set and its corresponding enable bit is turned on.</p>

BITS	DESCRIPTIONS	
[14]	CFR	<p>The <b>Control Frame Receive Interrupt</b> high indicates EMC receives a flow control frame. The CFR only available while EMC is operating on full duplex mode.</p> <p>If the CFR is high and EnCFR of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the CFR status.</p> <p>1'b0: The EMC doesn't receive the flow control frame. 1'b1: The EMC receives a flow control frame.</p>
[13:12]	Reserved	
[11]	RxBErr	<p>The <b>Receive Bus Error Interrupt</b> high indicates the memory controller replies ERROR response while EMC access system memory through RxDMA during packet reception process. Reset EMC is recommended while RxBErr status is high.</p> <p>If the RxBErr is high and EnRxBErr of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RxBErr status.</p> <p>1'b0: No ERROR response is received. 1'b1: ERROR response is received.</p>
[10]	RDU	<p>The Receive Descriptor Unavailable Interrupt high indicates that there is no available Rx descriptor for packet reception and RxDMA will stay at Halt state. Once, the RxDMA enters the Halt state, S/W must issues a write command to RSDR register to make RxDMA leave Halt state while new Rx descriptor is available.</p> <p>If the RDU is high and EnRDU of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RDU status.</p> <p>1'b0: Rx descriptor is available. 1'b1: Rx descriptor is unavailable.</p>
[9]	DENI	<p>The DMA Early Notification Interrupt high indicates the EMC has received the Length/Type field of the incoming packet.</p> <p>If the DENI is high and EnDENI of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the DENI status.</p> <p>1'b0: The Length/Type field of incoming packet has not received yet. 1'b1: The Length/Type field of incoming packet has received.</p>

Continued.

BITS	DESCRIPTIONS	
[8]	DFOI	<p>The <b>Maximum Frame Length Interrupt</b> high indicates the length of the incoming packet has exceeded the length limitation configured in DMARFC register and the incoming packet is dropped. If the DFOI is high and EnDFO of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the DFOI status.</p> <p>1'b0: The length of the incoming packet doesn't exceed the length limitation configured in DMARFC.</p> <p>1'b1: The length of the incoming packet has exceeded the length limitation configured in DMARFC.</p>
[7]	MMP	<p>The <b>More Missed Packet Interrupt</b> high indicates the MPCNT, Missed Packet Count, has overflow. If the MMP is high and EnMMP of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the MMP status.</p> <p>1'b0: The MPCNT has not rolled over yet.</p> <p>1'b1: The MPCNT has rolled over yet.</p>
[6]	RP	<p>Runt Packet Interrupt</p> <p>The RP high indicates the length of the incoming packet is less than 64 bytes and the packet is dropped. If the ARP of MCMDR register is set, the short packet is regarded as a good packet and RP will not be set.</p> <p>If the RP is high and EnRP of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RP status.</p> <p>1'b0: The incoming frame is not a short frame or S/W wants to receive a short frame.</p> <p>1'b1: The incoming frame is a short frame and dropped.</p>
[5]	ALIE	<p>The Alignment Error Interrupt high indicates the length of the incoming frame is not a multiple of byte.</p> <p>If the ALIE is high and EnALIE of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the ALIE status.</p> <p>1'b0: The frame length is a multiple of byte.</p> <p>1'b1: The frame length is not a multiple of byte.</p>

Continued.

BITS	DESCRIPTIONS	
[4]	RXGD	<p>The <b>Receive Good Interrupt</b> high indicates the frame reception has completed.</p> <p>If the RXGD is high and EnRXGD of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RXGD status.</p> <p>1'b0: The frame reception has not complete yet.</p> <p>1'b1: The frame reception has completed.</p>
[3]	PTLE	<p>The <b>Packet Too Long Interrupt</b> high indicates the length of the incoming packet is greater than 1518 bytes and the incoming packet is dropped. If the ALP of MCMDR register is set, the long packet will be regarded as a good packet and PTLE will not be set.</p> <p>If the PTLE is high and EnPTLE of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the PTLE status.</p> <p>1'b0: The incoming frame is not a long frame or S/W wants to receive a long frame.</p> <p>1'b1: The incoming frame is a long frame and dropped.</p>
[2]	RXOV	<p>The <b>Receive FIFO Overflow Interrupt</b> high indicates the RxFIFO overflow occurred during packet reception. While the RxFIFO overflow occurred, the EMC drops the current receiving packer. If the RxFIFO overflow occurred often, it is recommended that modify RxFIFO threshold control, the RxTHD of FFTCR register, to higher level.</p> <p>If the RXOV is high and EnRXOV of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RXOV status.</p> <p>1'b0: No RxFIFO overflow occurred during packet reception.</p> <p>1'b0: RxFIFO overflow occurred during packet reception.</p>
[1]	CRCE	<p>The <b>CRC Error Interrupt</b> high indicates the incoming packet incurred the CRC error and the packet is dropped. If the AEP of MCMDR register is set, the CRC error packet will be regarded as a good packet and CRCE will not be set.</p> <p>If the CRCE is high and EnCRCE of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the CRCE status.</p> <p>1'b0: The frame doesn't incur CRC error.</p> <p>1'b1: The frame incurred CRC error.</p>

Continued.

BITS	DESCRIPTIONS	
[0]	RXINTR	<p>The <b>Receive Interrupt</b> indicates the Rx interrupt status.</p> <p>If RXINTR high and its corresponding enable bit, EnRXINTR of MISTA register, is also high indicates the EMC generates Rx interrupt to CPU. If RXINTR is high but EnRXINTR of MISTA is disabled, no Rx interrupt is generated.</p> <p>The RXINTR is logic OR result of the bits 1~14 in MISTA register do logic AND with the corresponding bits in MIEN register. In other words, if one of the bits 1~14 in MISTA register is high and its corresponding enable bit in MIEN register is also enabled, the RXINTR will be high.</p> <p>Because the RXINTR is a logic OR result, clears bits 1~14 of MISTA register makes RXINTR be cleared, too.</p> <p>1'b0: No status of bits 1~14 in MISTA is set or no enable of bits 1~14 in MIEN is turned on.</p> <p>1'b1: At least one status of bits 1~14 in MISTA is set and its corresponding enable bit is turned on.</p>

**MAC General Status Register (MGSTA)**

The MGSTA also keeps the statuses of EMC. But the statuses in the MGSTA will not trigger any interrupt. The MGSTA is a write clear register and write 1 to corresponding bit clears the status.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MGSTA	0xFFFF0_30B4	R/W	MAC General Status Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved				TXHA	SQE	PAU	DEF
7	6	5	4	3	2	1	0
CCNT				Reserved	RFFull	RXHA	CFR

BITS	DESCRIPTIONS	
[31:12]	Reserved	-
[11]	TXHA	The Transmission Halted high indicates the next normal packet transmission process will be halted because the bit TXON of MCMDR is disabled by S/W. 1'b0: Next normal packet transmission process will go on. 1'b1: Next normal packet transmission process will be halted.
[10]	SQE	The Signal Quality Error high indicates the SQE error found at end of packet transmission on 10Mbps half-duplex mode. The SQE error check will only be done while both bit EnSQE of MCMDR is enabled and EMC is operating on 10Mbps half-duplex mode. 1'b0: No SQE error found at end of packet transmission. 1'b1: SQE error found at end of packet transmission.
[9]	PAU	The Transmission Paused high indicates the next normal packet transmission process will be paused temporarily because EMC received a PAUSE control frame, or S/W set bit SDPZ of MCMDR and make EMC to transmit a PAUSE control frame out. 1'b0: Next normal packet transmission process will go on. 1'b1: Next normal packet transmission process will be paused.
[8]	DEF	The Deferred Transmission high indicates the packet transmission has deferred once. The DEF is only available while EMC is operating on half-duplex mode. 1'b0: Packet transmission doesn't defer. 1'b1: Packet transmission has deferred once.
[7:4]	CCNT	The Collision Count indicates the how many collision occurred consecutively during a packet transmission. If the packet incurred 16 consecutive collisions during transmission, the CCNT will be 4'h0 and bit TXABT will be set to 1.
[3]	Reserved	-
[2]	RFFull	The RxFIFO Full indicates the RxFIFO is full due to four 64-byte packets are kept in RxFIFO and the following incoming packet will be dropped. 1'b0: The RxFIFO is not full. 1'b1: The RxFIFO is full and the following incoming packet will be dropped.
[1]	RXHA	The Receive Halted high indicates the next normal packet reception process will be halted because the bit RXON of MCMDR is disabled by S/W. 1'b0: Next normal packet reception process will go on. 1'b1: Next normal packet reception process will be halted.
[0]	CFR	The Control Frame Received high indicates EMC receives a flow control frame. The CFR only available while EMC is operating on full duplex mode. 1'b0: The EMC doesn't receive the flow control frame. 1'b1: The EMC receives a flow control frame.

### Missed Packet Count Register (MPCNT)

The MPCNT keeps the number of packets that were dropped due to various types of receive errors. The MPCNT is a read clear register. In addition, S/W also can write an initial value to MPCNT and the missed packet counter will start counting from that initial value. If the missed packet counter is overflow, the MMP of MISTA will be set.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MPCNT	0xFFFF0_30B8	R/W	Missed Packet Count Register	0x0000_7FFF

31	30	29	28	27	26	25	24
Reserved

Reserved							
15	14	13	12	11	10	9	8
MPC							
7	6	5	4	3	2	1	0
MPC							

BITS	DESCRIPTIONS	
[31:16]	Reserved	-
[15:0]	MPC	<p>The <b>Miss Packet Count</b> indicates the number of packets that were dropped due to various types of receive errors. The following type of receiving error makes missed packet counter increase:</p> <ul style="list-style-type: none"> <li>▪ Incoming packet is incurred RxFIFO overflow.</li> <li>▪ Incoming packet is dropped due to RXON is disabled.</li> <li>▪ Incoming packet is incurred CRC error.</li> </ul>

### MAC Receive Pause Count Register (MRPC)

The EMC of W90P710 supports the PAUSE control frame reception and recognition. If EMC received a PAUSE control frame, the operand field of the PAUSE control frame will be extracted and stored in the MRPC register. The MRPC register will keep the same while Tx of EMC is pausing due to the PAUSE control frame is received. The MRPC is read only and write to this register has no effect.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MRPC	0xFFFF0_30BC	R	MAC Receive Pause Count Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
MRPC							
7	6	5	4	3	2	1	0
MRPC							

BITS	DESCRIPTIONS	
[31:16]	Reserved	-
[15:0]	MRPC	The MAC Receive Pause Count keeps the operand field of the PAUSE control frame. It indicates how many slot time (512 bit time) the Tx of EMC will be paused.

## MAC Receive Pause Current Count Register (MRPCC)

The EMC of W90P710 supports the PAUSE control frame reception and recognition. If EMC received a PAUSE control frame, the operand field of the PAUSE control frame will be extracted and stored into a down count timer. The MRPCC shows the current value of that down count timer for S/W to know how long the Tx of EMC will be paused. The MRPCC is read only and write to this register has no effect.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MRPCC	0xFFFF0_30C0	R	MAC Receive Pause Current Count Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
MRPCC							
7	6	5	4	3	2	1	0
MRPCC							

BITS	DESCRIPTIONS	
[31:16]	Reserved	-
[15:0]	MRPCC	The <b>MAC Receive Pause Current Count</b> shows the current value of that down count timer. If a new PAUSE control frame is received before the timer count down to zero, the new operand of the PAUSE control frame will be stored into the down count timer and the timer starts count down from the new value.

### MAC Remote Pause Count Register (MREPC)

The EMC of W90P710 supports the PAUSE control frame transmission. After the PAUSE control frame is transmitted out completely, a timer starts to count down from the value of operand of the transmitted PAUSE control frame. The MREPC shows the current value of this down count timer. The MREPC is read only and write to this register has no effect.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
MREPC	0xFFFF0_30C4	R	MAC Remote Pause Count Register	0x0000_0000

31	30	29	28	27	26	25	24

Reserved							
15	14	13	12	11	10	9	8
RXFLT							
7	6	5	4	3	2	1	0
RXFLT							

BITS	DESCRIPTIONS	
[31:16]	Reserved	
[15:0]	RXFLT	The Receive Frame Length/Type keeps the Length/Type field of each incoming Ethernet packet. If the bit EnDEN of MIEN is enabled and the Length/Type field of incoming packet has received, the bit DENI of MISTA will be set and trigger interrupt. And, the content of Length/Type field will be stored in RXFLT.

### Current Transmit Descriptor Start Address Register (CTXDSA)

The CTXDSA keeps the start address of Tx descriptor that is used by TxDMA currently. The CTXDSA is read only and write to this register has no effect.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
CTXDSA	0xFFFF0_30C C	R	Current Transmit Descriptor Start Address Register	0x0000_0000

31	30	29	28	27	26	25	24

Reserved				BistFail		Finish	BME n

BITS	DESCRIPTIONS	
[31:5]	Reserved	-
[3:2]	BistFail	<p>The <b>BIST Fail</b> indicates if the BIST test fails or succeeds. If the BistFail is low at the end, the embedded SRAM pass the BIST test, otherwise, it is faulty. The BistFail will be high once the BIST detects the error and remains high during the BIST operation. If BistFail[2] high indicates the embedded SRAM for Tx FIFO BIST test failed. If BistFail[3] high indicates the embedded SRAM for Rx FIFO BIST test failed.</p> <p>The BistFail is a write clear field. Write 1 to this field clears the content and write 0 has no effect.</p>
[1]	Finish	<p>The <b>BIST Operation Finish</b> indicates the end of the BIST operation. When BIST controller finishes all operations, this bit will be high.</p> <p>The Finish is a write clear field. Write 1 to this field clears the content and write 0 has no effect.</p>
[0]	BMEn	<p>The <b>BIST Mode Enable</b> is used to enable the BIST operation. If high enables the BIST controller to do embedded SRAM test. This bit is also used to do the reset for BIST circuit. It is necessary to reset the BIST circuit one clock cycle at least in order to initialize the BIST properly.</p> <p>The BMEn can be disabled by write 0.</p>

## 7.6 GDMA Controller

The W90P710 has a two-channel general DMA controller, called the GDMA. The two-channel GDMA performs the following data transfers without the CPU intervention:

- Memory-to-memory (memory to/from memory)
- Memory –to – IO
- IO- to -memory

The on-chip GDMA can be started by the software or external DMA request nXDREQ. Software can also be used to restart the GDMA operation after it has been stopped. The CPU can recognize the completion of a GDMA operation by software polling or when it receives an internal GDMA interrupt. The W90P710 GDMA controller can increment source or destination address, decrement them as well, and conduct 8-bit (byte), 16-bit (half-word), or 32-bit (word) data transfers.

The GDMA includes the following features

- AMBA AHB compliant
- Supports 4-data burst mode to boost performance
- Provides support for external GDMA device
- Demand mode speeds up external GDMA operations

### 7.6.1 GDMA Functional Description

The GDMA directly transfers data between source and destination. The GDMA starts to transfer data after it receives service requests from nXDREQ signal or software. When the entire data have been transferred completely, the GDMA becomes idle. Nevertheless, if another transfer is needed, then the GDMA must be programmed again. There are three transfer modes:

#### **Single Mode**

Single mode requires a GDMA request for each data transfer. A GDMA request (nXDREQ or software) causes one byte, one half-word, or one word to transfer if the 4-data burst mode is disabled, or four times of transfer width if the 4-data burst mode is enabled.

#### **Block Mode**

The assertion of a single GDMA request causes all of the data to be transferred in a single operation. The GDMA transfer is completed when the current transfer count register reaches zero.

#### **Demand Mode**

The GDMA continues transferring data until the GDMA request input nXDREQ becomes inactive.

[20]	GDMATERR	<p><b>GDMA Transfer Error</b></p> <p>1'b0 = No error occurs            1'b1 = Hardware sets this bit on a GDMA transfer failure            Transfer error will generate GDMA interrupt</p>

Continued

BITS	DESCRIPTIONS	
[19]	AUTOIEN	<p><b>Auto initialization Enable</b>            1'b0 = Disables auto initialization            1'b1 = Enables auto initialization, the GDMA_CSRC0/1, GDMA_CDST0/1, and GDMA_CTCNT0/1 registers are updated by the GDMA_SRC0/1, GDMA_DST0/1, and GDMA_TCNT0/1 registers automatically when transfer is complete.</p>
[18]	TC	<p><b>Terminal Count</b>            1'b0 = Channel does not expire            1'b1 = Channel expires; this bit is set only by GDMA hardware, and clear by software to write logic 0.            TC [18] is the GDMA interrupt flag. TC [18] or GDMATERR[20] will generate interrupt</p>
[17]	BLOCK	<p><b>Bus Lock</b>            1'b0 = Unlocks the bus during the period of transfer            1'b1 = Locks the bus during the period of transfer</p>
[16]	SOFTREQ	<p><b>Software Triggered GDMA Request</b>            Software can request the GDMA transfer service by setting this bit to 1. This bit is automatically cleared by hardware when the transfer is completed. This bit is available only while GDMAMS [3:2] register bits are set on software mode (memory to memory).</p>
[15]	DM	<p><b>Demand Mode</b>            1'b0 = Normal external GDMA mode            1'b1 = When this bit is set to 1, the external GDMA operation is speeded up. When external GDMA device is operating in the demand mode, the GDMA transfers data as long as the external GDMA request signal nXDREQ is active. The amount of data transferred depends on how long the nXDREQ is active. When the nXDREQ is active and GDMA gets the bus in Demand mode, DMA holds the system bus until the nXDREQ signal becomes non-active. Therefore, the period of the active nXDREQ signal should be carefully tuned such that the entire operation does not exceed an acceptable interval (for example, in a DRAM refresh operation).</p>
[14]	Reserved	-

## **7.7 USB Host Controller**

The **Universal Serial Bus (USB)** is a low-cost, low-to-mid-speed peripheral interface standard intended for modem, scanners, PDAs, keyboards, mice, and other devices that do not require a high-bandwidth parallel interface. The USB is a 4-wire serial cable bus that supports serial data exchange between a Host Controller and a network of peripheral devices. The attached peripherals share USB bandwidth through a host-scheduled, token-based protocol. Peripherals may be attached, configured, used, and detached, while the host and other peripherals continue operation (i.e. hot plug and unplug is supported).

A major design goal of the USB standard was to allow flexible, plug-and-play networks of USB devices. In any USB network, there will be only one host, but there can be many devices and hubs.

The USB Host Controller has the following features:

- **Open Host Controller Interface (OHCI)** Revision 1.0 compatible.
- USB Revision 1.1 compatible
- Supports both low-speed (1.5 Mbps) and full-speed (12Mbps) USB devices.
- Handles all the USB protocol.
- Built-in DMA for real-time data transfer
- Multiple low power modes for efficient power management

### **7.7.1 USB Host Functional Description**

#### **7.7.1.1. AHB Interface**

The OpenHCI Host Controller is connected to the system by the AHB bus. The design requires both master and slave bus operations. As a master, the Host Controller is responsible for running cycles on the AHB bus to access EDs and TDs as well as transferring data between memory and the local data buffer. As a slave, the Host Controller monitors the cycles on the AHB bus and determines when to respond to these cycles. Configuration and non-real-time control access to the Host Controller operational registers are through the AHB bus slave interface.

#### **7.7.1.2. Host Controller**

##### **List Processing**

The List Processor manages the data structures from the Host Controller Driver and coordinates all activity within the Host Controller.

##### **Frame Management**

Frame Management is responsible for managing the frame specific tasks required by the USB specification and the OpenHCI specification. These tasks are:

- 1) Management of the OpenHCI frame specific Operational Registers
- 2) Operation of the Largest Data Packet Counter.
- 3) Performing frame qualifications on USB Transaction requests to the SIE.
- 4) Generate SOF token requests to the SIE.

## Interrupt Processing

Interrupts are the communication method for HC-initiated communication with the Host Controller Driver. There are several events that may trigger an interrupt from the Host Controller. Each specific event sets a specific bit in the *HcInterruptStatus* register.

## Host Controller Bus Master

The Host Controller Bus Master is the central block in the data path. The Host Controller Bus Master coordinates all access to the AHB Interface. There are two sources of bus mastering within Host Controller: the List Processor and the Data Buffer Engine.

## Data Buffer

The Data Buffer serves as the data interface between the Bus Master and the SIE. It is a combination of a 64-byte latched based bi-directional asynchronous FIFO and a single Dword AHB Holding Register.

### 7.7.1.3. USB Interface

The USB interface includes the integrated Root Hub with two external ports, Port 1 and Port 2 as well as the Serial Interface Engine (SIE) and USB clock generator. The interface combines responsibility for executing bus transactions requested by the HC as well as the hub and port management specified by USB.

15	14	13	12	11	10	9	8
Reserved					RWCE	RWC	IR
7	6	5	4	3	2	1	0
HCFS		BLE	CLE	ISE	PLE	CBR	

BITS	DESCRIPTION	
[31:11]	Reserved	<b>Reserved.</b> Read/Write 0's
[10]	RWCE	<b>RemoteWakeupConnectedEnable</b> If a remote wakeup signal is supported, this bit enables that operation. Since there is no remote wakeup signal supported, this bit is ignored.
[9]	RWC	<b>RemoteWakeupConnected</b> This bit indicated whether the HC supports a remote wakeup signal. This implementation does not support any such signal. The bit is hard-coded to '0.'
[8]	INR	<b>InterruptRouting</b> This bit is used for interrupt routing: 0: Interrupts routed to normal interrupt mechanism (INT). 1: Interrupts routed to SMI.
[7:6]	HCFS	<b>HostControllerFunctionalState</b> This field sets the Host Controller state. The Controller may force a state change from USB SUSPEND to USB RESUME after detecting resume signaling from a downstream port. States are: 00: USB RESET 01: USBRESUME 10: USBOPERATIONAL 11: USBSUSPEND
[5]	BLE	<b>BulkListEnable</b> When set this bit enables processing of the Bulk list.
[4]	CLE	<b>Control Listenable</b> When set this bit enables processing of the Control list.
[3]	ISE	<b>Isochronous Enable</b> When clear, this bit disables the Isochronous List when the Periodic List is enabled (so Interrupt EDs may be serviced). While processing the Periodic List, the Host Controller will check this bit when it finds an isochronous ED.
[2]	PLE	<b>Periodic Listenable</b> When set, this bit enables processing of the Periodic (interrupt and isochronous) list. The Host Controller checks this bit prior to attempting any periodic transfers in a frame.
[1:0]	CBR	<b>ControlBulkServiceRatio</b> Specifies the number of Control Endpoints serviced for every Bulk Endpoint. Encoding is N-1 where N is the number of Control Endpoints (i.e. '00' = 1 Control Endpoint; '11' = 3 Control Endpoints)

## Host Controller Command Status Register

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
HcCommandStatus	0xFFFF0_5008	R/W	Host Controller Command Status Register	0x0000_0000

BITS	DESCRIPTION	
[31:18]	Reserved	<b>Reserved</b>
[17:16]	SOC	<b>ScheduleOverrunCount</b> This field is increment every time the <b>SchedulingOverrun</b> bit in <i>HcInterruptStatus</i> is set. The count wraps from '11' to '00.'
[15:4]	Reserved	<b>Reserved.</b> Read/Write 0's
[3]	OCR	<b>OwnershipChangeRequest</b> When set by software, this bit sets the <b>OwnershipChange</b> field in <i>HcInterruptStatus</i> . The bit is cleared by software.
[2]	BLF	<b>BulkListFilled</b> Set to indicate there is an active ED on the Bulk List. The bit may be set by either software or the Host Controller and cleared by the Host Controller each time it begins processing the head of the Bulk List.
[1]	CLF	<b>ControlListFilled</b> Set to indicate there is an active ED on the Control List. It may be set by either software or the Host Controller and cleared by the Host Controller each time it begins processing the head of the Control List.
[0]	HCR	<b>HostControllerReset</b> This bit is set to initiate the software reset. This bit is cleared by the Host Controller, upon completed of the reset operation.

## Host Controller Interrupt Status Register

All bits are set by hardware and cleared by software.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE

7	6	5	4	3	2	1	0
NDSP							

BITS		DESCRIPTION
[31:24]	POTPGT	<b>PowerOnToPowerGoodTime</b> This field value is represented as the number of 2 ms intervals, which ensuring that the power switching is effective within 2 ms. Only bits [25:24] is implemented as R/W. The remaining bits are read only as '0'. It is not expected that these bits be written to anything other than 1h, but limited adjustment is provided. This field should be written to support system implementation. This field should always be written to a non-zero value.
[23:13]	Reserved	<b>Reserved.</b> Read/Write 0's
[12]	NOCP	<b>NoOverCurrentProtection</b> Global over-current reporting implemented in HYDRA-2. This bit should be written to support the external system port over-current implementation. 0 = Over-current status is reported 1 = Over-current status is not reported
[11]	OCPM	<b>OverCurrentProtectionMode</b> Global over-current reporting implemented in HYDRA-2. This bit should be written 0 and is only valid when NoOverCurrentProtection is cleared. 0 = Global Over-Current 1 = Individual Over-Current
[10]	DEVT	<b>DeviceType</b> HYDRA-4is not a compound device.
[9]	NPSW	<b>NoPowerSwitching</b> Global power switching implemented in HYDRA-2. This bit should be written to support the external system port power switching implementation. 0 = Ports are power switched. 1 = Ports are always powered on.
[8]	PSWM	<b>PowerSwitchingMode</b> Global power switching mode implemented in HYDRA-2. This bit is only valid when NoPowerSwitching is cleared. This bit should be written '0'. 0 = Global Switching 1 = Individual Switching
[7:0]	NDSP	<b>NumberDownstreamPorts</b> HYDRA-4 supports two downstream ports.

## Host Controller Root Hub Descriptor B Register

This register is only reset by a power-on reset. It is written during system initialization to configure the Root Hub. These bits should not be written during normal operation.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE

[30:18]	Reserved	<b>Reserved.</b> Read/Write 0's
[17]	OVIC	<b>OverCurrentIndicatorChange</b> This bit is set when OverCurrentIndicator changes. Writing a '1' clears this bit. Writing a '0' has no effect.
[16]	LPSC	<b>(Read) LocalPowerStatusChange</b> Not supported. Always read '0'. (Write) SetGlobalPower Write a '1' issues a SetGlobalPower command to the ports. Writing a '0' has no effect.
[15]	DRWE	<b>(Read) DeviceRemoteWakeupEnable</b> This bit enables ports' ConnectStatusChange as a remote wakeup event. 0 = disabled 1 = enabled (Write) SetRemoteWakeupEnable Writing a '1' sets DeviceRemoteWakeupEnable. Writing a '0' has no effect.
[14:2]	Reserved	<b>Reserved.</b> Read/Write 0's

Continued.

BITS		DESCRIPTION
[1]	OVRCI	<p><b>OverCurrentIndicator</b></p> <p>This bit reflects the state of the OVRCUR pin. This field is only valid if NoOverCurrentProtection and OverCurrentProtectionMode are cleared.</p> <p>0 = No over-current condition 1 = Over-current condition</p>
[0]	LOPS	<p>(Read) <b>LocalPowerStatus</b> Not Supported. Always read '0'.</p> <p>(Write) <b>ClearGlobalPower</b> Writing a '1' issues a <b>ClearGlobalPower</b> command to the ports. Writing a '0' has no effect.</p>

### Host Controller Root Hub Port Status [1][2]

This register is reset by the USBRESET state.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
HcRhPortStatus [1]	0xFFF0_5054	R/W	Host Controller Root Hub Port Status [1]	0x0000_0000
HcRhPortStatus [2]	0xFFF0_5058	R/W	Host Controller Root Hub Port Status [2]	0x0000_0000

7	6	5	4	3	2	1	0
Reserved			SPR	CPS	SPS	SPE	DRM

BITS		DESCRIPTION
[31:21]	Reserved	<b>Reserved.</b> Read/Write 0's
[20]	PRSC	<p><b>PortResetStatusChange</b></p> <p>This bit indicates that the port reset signal has completed.</p> <p>0 = Port reset is not complete. 1 = Port reset is complete.</p>

Continued.

BITS		DESCRIPTION
[19]	POCIC	<b>PortOverCurrentIndicatorChange</b> This bit is set when <b>OverCurrentIndicator</b> changes. Writing a '1' clears this bit. Writing a '0' has no effect.
[18]	PSSC	<b>PortSuspendStatusChange</b> This bit indicates the completion of the selective resume sequence for the port. 0 = Port is not resumed. 1 = Port resume is complete.
[17]	PESC	<b>PortEnableStatusChange</b> This bit indicates that the port has been disabled due to a hardware event (cleared <b>PortEnableStatus</b> ). 0 = Port has not been disabled. 1 = PortEnableStatus has been cleared.
[16]	CSC	<b>ConnectStatusChange</b> This bit indicates a connect or disconnect event has been detected. Writing a '1' clears this bit. Writing a '0' has no effect. 0 = No connect/disconnect event. 1 = Hardware detection of connect/disconnect event. Note: If DeviceRemoveable is set, this bit resets to '1'.
[15:10]	Reserved	<b>Reserved.</b> Read/Write 0's
[9]	LSDA	(Read) <b>LowSpeedDeviceAttached</b> This bit defines the speed (and bud idle) of the attached device. It is only valid when <b>CurrentConnectStatus</b> is set. 0 = Full Speed device 1 = Low Speed device (Write) <b>ClearPortPower</b> Writing a '1' clears <b>PortPowerStatus</b> . Writing a '0' has no effect
[8]	PPS	(Read) <b>PortPowerStatus</b> This bit reflects the power state of the port regardless of the power switching mode. 0 = Port power is off. 1 = Port power is on. Note: If <b>NoPowerSwitching</b> is set, this bit is always read as '1'. (Write) <b>SetPortPower</b> Writing a '1' sets <b>PortPowerStatus</b> . Writing a '0' has no effect.
[7:5]	Reserved	<b>Reserved.</b> Read/Write 0's
[4]	SPR	(Read) <b>PortResetStatus</b> 0 = Port reset signal is not active. 1 = Port reset signal is active. (Write) <b>SetPortReset</b> Writing a '1' sets <b>PortResetStatus</b> . Writing a '0' has no effect.

Continued.

BITS		DESCRIPTION
[3]	CPS	(Read) <b>PortOverCurrentIndicator</b> HYDRA-2 supports global over-current reporting. This bit reflects the state of the OVRCUR pin dedicated to this port. This field is only valid if <b>NoOverCurrentProtection</b> is cleared and <b>OverCurrentProtectionMode</b> is set. 0 = No over-current condition 1 = Over-current condition  (Write) <b>ClearPortSuspend</b> Writing a '1' initiates the selective resume sequence for the port. Writing a '0' has no effect.
[2]	SPS	(Read) <b>PortSuspendStatus</b> 0 = Port is not suspended 1 = Port is selectively suspended  (Write) <b>SetPortSuspend</b> Writing a '1' sets <b>PortSuspendStatus</b> . Writing a '0' has no effect.
[1]	SPE	(Read) <b>PortEnableStatus</b> 0 = Port disabled. 1 = Port enabled.  (Write) <b>SetPortEnable</b> Writing a '1' sets <b>PortEnableStatus</b> . Writing a '0' has no effect.
[0]	DRM	(Read) <b>CurrentConnectStatus</b> 0 = No device connected. 1 = Device connected.  NOTE: If <b>DeviceRemoveable</b> is set (not removable) this bit is always '1'.  (Write) <b>ClearPortEnable</b> Writing '1' a clears <b>PortEnableStatus</b> . Writing a '0' has no effect.

### USB Operational Mode Enable Register

This register selects which operational mode is enabled. Bits defined as write-only are read as 0's.

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
OperationalModeEnable	0xFFFF0_5204	R/W	USB Operational Mode Enable Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							SIEPD
7	6	5	4	3	2	1	0
Reserved				OVRCUR	Reserved		DBREG

BITS		BIT DESCRIPTION
[31:9]	Reserved	<b>Reserved.</b> Read/write 0
[8]	SIEPD	<b>SIE Pipeline Disable</b> When set, waits for all USB bus activity to complete prior to returning completion status to the List Processor. This is a failsafe mechanism to avoid potential problems with the clk_dr transition between 1.5 MHz and 12 MHz.
[7:4]	Reserved	<b>Reserved.</b> Read/write 0
[3]	OVRCURP	<b>OVRCURP (over current indicator polarity)</b> When the OVRCURP bit is clear, the OVRCUR <b>non-inverted</b> to input into USB host controller. In contrast, when the OVRCURP bit is set, the OVRCUR <b>inverted</b> to input into USB host controller.
[2:1]	Reserved	<b>Reserved.</b> Read/write 0
[0]	DBREG	<b>Data Buffer Region 16</b> When set, the size of the data buffer region is 16 bytes. Otherwise, the size is 32 bytes.

### 7.7.3 HCCA

### 7.7.4 Endpoint Descriptor

### 7.7.5 Transfer Descriptor

## 7.8 USB Device Controller

The USB controller interfaces the AHB bus and the USB bus. The USB controller contains both the AHB master interface and AHB slave interface. CPU programs the USB controller through the AHB slave interface. For IN or OUT transfer, the USB controller needs to write data to memory or read data from memory through the AHB master interface. The USB controller also contains the USB transceiver to interface the USB.

## 7.8.1 USB Endpoints

It consists of four endpoints, designated EP0, EPA, EPB and EPC. Each is intended for a particular use as described below:

EP0: the default endpoint uses control transfer (In/Out) to handle configuration and control functions required by the USB specification. Maximum packed size is 16 bytes.

EPA: designed as a general endpoint. This endpoint could be programmed to be an Interrupt IN endpoint or an Isochronous IN endpoint or a Bulk In endpoint or Bulk OUT endpoint.

EPB: designed as a general endpoint. This endpoint could be programmed to be an Interrupt IN endpoint or an Isochronous IN endpoint or a Bulk In endpoint or Bulk OUT endpoint.

EPC: designed as a general endpoint. This endpoint could be programmed to be an Interrupt IN endpoint or an Isochronous IN endpoint or a Bulk In endpoint or Bulk OUT endpoint.

## 7.8.2 Standard device request

The USB controller has built-in hard-wired state machine to automatically respond to USB standard device request. It also supports to detect the class and vendor requests. For Get Descriptor request and Class or Vendor command, the firmware will control these procedures.

## 7.8.3 USB Device Register Description

### USB Control Register (USB\_CTL)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
USB_CTL	0xFFFF0_6000	R/W	USB control register	0x0000_0000

## 7.9 SDIO Host Controller

The SDIO host controller of W90P710 supports Secure Digital card devices (SD, SDIO & MMC). The SDIO controller also supports DMA function to reduce the intervention of CPU for data transfer between flash memory card and system memory.

There are two 512B internal buffers embedded in the SDIO host controller to buffer the data temporarily for DMA transfer between flash memory card and system memory.

The SDIO host controller features are shown as below:

- Directly connect to Secure Digital (SD, MMC or SDIO) flash memory card.
- Supports DMA function to accelerate the data transfer between the internal buffer, external SDRAM, and flash memory card.
- Two 512 bytes internal buffers are embedded inside of the SDIO host controller.
- No SPI mode.

### 7.9.1 Functional Description

SDIO controller provides three signals, CLK, CMD and DAT[3:0], to all SD cards. CLK is a clock output signal. CM and DAT[3:0] are bi-direction command and data signals, respectively.

The frequency of CLK is equal to  $(\text{engine clock frequency})/(\text{SD\_CLK}+1)$ , where SD\_CLK is the value of the SD clock control register. To save power, CLK is active only when there are activities between SDIO host controller and SD cards. Otherwise, CLK keeps inactive state (LOW).

According to the SD specification, SDIO host controller provides several operations to communicate with SD Cards efficiently. The CPU writes to the SD access control register to setup the operations.

When the command output enable bit of SD access control register is set, SDIO host controller transfers a 48-bit command to one or more SD cards. When the transfer is done, this bit is reset to 0 automatically.

For a 48-bits command, the 6-bits command number is coming from SD CMD code register and the 32-bits command argument is coming from SD command argument 1-4 registers. All other bits (including start bit, end bit and the CRC-7bits) are generated by SDIO host controller H/W circuit.

When the response input enable bit of SD access control register is set, SDIO host controller waits for a 48-bit response form one or more SD cards. When a 48-bit response is received, this bit is reset to 0 automatically.

The first 40 bits of the received response are stored into SD received response token1 – 5 registers.

The last 8 bits are CRC-7 bits and end bit. SDIO host controller H/W circuit checks CRC-7 and reports the result to SD status register.

When the data input enable bit of SD access control register is set, SDIO host controller waits for a block of data from a specific SD card. When a block of data is received, this bit is cleared to 0 automatically.

The received block of data is stored into the system memory and the address is starting from the address specified by S/W.

SDIO host controller checks the associated CRC-16 bits and reports the result to SD status register.

If the data-input interrupt is enabled, an interrupt will occur when the data transfer is finished. The data input status bit of SD status register will be set as 1 for this interrupt. Thus, the CPU can identify a data-input interrupt by reading this bit.

When the data output enable bit of SD access control register is set, SDIO host controller transfers a block of data to a specific MMC card. When the data transfer is finished, this bit is cleared to 0 automatically.

Before the data is transferred, the data to be transmitted must be stored into system memory and the S/W must specify the starting address where the data is stored.

SDIO host controller will generate the associated CRC-16 bits by itself. After the data is transmitted, it also checks the CRC-status response from the SD card. The check result is stored into the SD status register.

If the data-output interrupt is enabled, an interrupt will occur when the data transfer is finished. **The data output status bit of SD status register will be set as 1 for this interrupt. Thus, the CPU can identify a data-output interrupt by reading this bit.**

1. When the response R2 input enable bit of SD access control register is set, SDIO host controller transfers a block of data to a specific SD card. When the data transfer is finished and this bit is set, SDIO host controller will wait for a 136-bit R2 response from SD card. When the R2 response is completely received, the bit is reset to 0 automatically.
  - The received data of R2 response token (136-bit) is stored into the system memory, starting from the address specified by software.
  - SDIO host controller checks the CRC-7 and reports the result to SD status register.
2. When the 74-clock cycles output enable bit of SD access control register is set, SDIO host controller generates 74 clock cycles without any CMD or DAT activity. After the 74 clock cycles have been generated, the bit is reset to 0 automatically.

### 7.9.2 Register Mapping

BITS	DESCRIPTIONS	
[31:8]	Reserved	-
[7:0]	SD_RSP_TK1	<b>SD Receive Response Token 1</b> SD host controller will receive a response token for getting a reply from SD card. This register records the bit 15-8 of the response token.

### SD Block Length Register (SDBLEN)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
SDBLEN	0xFFFF0_731C	R/W	SD Block Length Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							SDBLEN
7	6	5	4	3	2	1	0
SDBLEN							

BITS	DESCRIPTIONS	
[31:9]	Reserved	-
[8:0]	SDBLEN	<b>SD BLOCK LENGTH</b> A 9-bit value specifies the SD transfer byte count.

### Flash Buffer 0 Registers (FB0\_0 ~ FB0\_127)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FB0_0 ..... FB0_127	0xFFFF0_7400 ..... 0xFFFF0_75FC	R/W	Flash Buffer 0	Undefined

31	30	29	28	27	26	25	24
----	----	----	----	----	----	----	----

<b>FBuf0</b>							
23	22	21	20	19	18	17	16
<b>FBuf0</b>							
15	14	13	12	11	10	9	8
<b>FBuf0</b>							
7	6	5	4	3	2	1	0
<b>FBuf0</b>							

BITS	DESCRIPTIONS	
[31:0]	<b>FBuf0</b>	<p><b>Flash Buffer 0</b></p> <p>These register ports supports the data read from embedded flash buffer 0. The embedded flash buffer size is 512 bytes, the 128 words. Consequently, the address range for flash buffer 0 is from 0xFFFF0_7400 to 0xFFFF0_75FC.</p>

**Flash Buffer 1 Registers (FB1\_0 ~ FB1\_127)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FB1_0 ..... FB1_127	0xFFFF0_7800 ..... 0xFFFF0_79FC	R/W	Flash Buffer 1	Undefined

31	30	29	28	27	26	25	24
<b>FBuf1</b>							
23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8
<b>FBuf1</b>							
7	6	5	4	3	2	1	0
<b>FBuf1</b>							

BITS	DESCRIPTIONS	
[31:0]	<b>FBuf1</b>	<p><b>Flash Buffer 1</b></p> <p>These register ports supports the data read from embedded flash buffer 1. The embedded flash buffer size is 512 bytes, the 128 words. Consequently, the address range for flash buffer 1 is from 0xFFFF0_7800 to 0xFFFF0_79FC.</p>

## 7.10 LCD Controller

### 7.10.1 Main Features

#### STN LCD Display

- Supports Sync-type STN LCD
- Supports 2 types of LCD panels: 4-bit single scan and 8-bit single scan display type
- Supports 16 gray levels for Monochrome STN LCD panel
- Supports 4096(12bpp) color for Color STN LCD panel
- Virtual coloring method: Frame Rate Control (16-level)
- Anti-flickering method: Time-based Dithering

#### TFT LCD Display

- Supports Sync-type TFT LCD and Sync-type High-color TFT LCD
- Supports 1, 2, 4 or 8-bpp palette color display
- Supports 12-bpp/16-bpp/18-bpp/24-bpp non-palette true color display

#### TV Encoder

- Supports 8-bit YCbCr data output format to connect with external TV Encoder

#### LCD Preprocessing

- Image re-size
  - Horizontal/Vertical Down-Scaling
  - Horizontal/Vertical Up-Scaling
- Image relocation
  - Horizontal /Vertical Cropping
  - Virtual Display

#### LCD Post processing

- Support for one OSD overlay
- Support various OSD function

#### Others

- Color-look up table size 256x32 bit for TFT used
- Dedicated DMA for block transfer mode
- Supports image which is RGB formats or YUV422 formats.

## 7.10.2 LCD Register MAP

REGISTER NAME	DESCRIPTION	R/W	ADDRESS
<b>LCD Controller</b>			
LCDCON	LCD Controller control register	Read/Write	0xFFFF0_8000
<b>LCD Interrupt Control</b>			
LCDINTENB	LCD interrupt enable register	Read/Write	0xFFFF0_8004
LCDINTS	LCD interrupt status register	Read	0xFFFF0_8008
LCDINTC	LCD interrupt clear Register	Write	0xFFFF0_800C
<b>LCD Pre-processing</b>			
OSDUPSCF	OSD data Horizontal/Vertical up-scaling factor	Read/Write	0xFFFF0_8010
VDUPSCF	Video data Horizontal/Vertical up-scaling factor	Read/Write	0xFFFF0_8014
OSDDNSCF	OSD data Horizontal/Vertical down-scaling factor	Read/Write	0xFFFF0_8018
VDDNSCF	Video data Horizontal/Vertical down-scaling factor	Read/Write	0xFFFF0_801C
<b>LCD FIFO Control</b>			
FIFOCON	FIFOs control register	Read/Write	0xFFFF0_8020
FIFOSTATUS	FIFOs status	Read	0xFFFF0_8024
FIFO1PRM	FIFO1 parameters	Read/Write	0xFFFF0_8028
FIFO2PRM	FIFO2 parameters	Read/Write	0xFFFF0_802C
FIFO1SADDR	FIFO1 transfer start address register	Read/Write	0xFFFF0_8030
FIFO2SADDR	FIFO2 transfer start address register	Read/Write	0xFFFF0_8034
FIFO1DREQCNT	FIFO1 data request transfer count register	Read/Write	0xFFFF0_8038
FIFO2DREQCNT	FIFO2 data request transfer count register	Read/Write	0xFFFF0_803C
FIFO1CURADR	FIFO1 current access address	Read	0xFFFF0_8040
FIFO2CURADR	FIFO2 current access address	Read	0xFFFF0_8044
FIFO1RELACOLCNT	FIFO1 real column count register	Read/Write	0xFFFF0_8048
FIFO2RELACOLCNT	FIFO2 real column count register	Read/Write	0xFFFF0_804C
<b>Color Generation</b>			
LUTENTRY1	TFT: lookup table entry index register	Read/Write	0xFFFF0_8060
LUTENTRY2	TFT: lookup table entry index register	Read/Write	0xFFFF0_8064
LUTENTRY3	TFT: lookup table entry index register	Read/Write	0xFFFF0_8068
LUTENTRY4	TFT: lookup table entry index register	Read/Write	0xFFFF0_806C

Continued.

REGISTER NAME	DESCRIPTION	R/W	ADDRESS
<b>Color Generation</b>			
TMDDITHP1	Gray level dithered data duty pattern	Read/Write	0xFFFF0_8070
TMDDITHP2	Gray level dithered data duty pattern	Read/Write	0xFFFF0_8074
TMDDITHP3	Gray level dithered data duty pattern	Read/Write	0xFFFF0_8078
TMDDITHP4	Gray level dithered data duty pattern	Read/Write	0xFFFF0_807C
TMDDITHP5	Gray level dithered data duty pattern	Read/Write	0xFFFF0_8080
TMDDITHP6	Gray level dithered data duty pattern	Read/Write	0xFFFF0_8084
TMDDITHP7	Gray level dithered data duty pattern	Read/Write	088
<b>LCD Post-processing</b>			
DDISPCP	Dummy Display Color Pattern Register	Read/Write	0xFFFF0_8090
VDISPWINS	Valid Display Window Starting Coordinate Register	Read/Write	0xFFFF0_8094
VDISPWINE	Valid Display Window Ending Coordinate Register	Read/Write	0xFFFF0_8098
OSDWINS	OSD Window Starting Coordinate Register	Read/Write	0xFFFF0_809C
OSDWINE	OSD Window Ending Coordinate Register	Read/Write	0xFFFF0_80A0
OSDOVCN	OSD Overlay Control Register	Read/Write	0xFFFF0_80A4
OSDKYP	OSD Overlay Color-Key Pattern	Read/Write	0xFFFF0_80A8
OSDKYM	OSD Overlay Color-Key Mask	Read/Write	0xFFFF0_80AC
<b>LCD Timing Generation</b>			
LCDTCON1	LCD Timing Control Register1	Read/Write	0xFFFF0_80B0
LCDTCON2	LCD Timing Control Register2	Read/Write	0xFFFF0_80B4
LCDTCON3	LCD Timing Control Register3	Read/Write	0xFFFF0_80B8
LCDTCON4	LCD Timing Control Register4	Read/Write	0xFFFF0_80BC
LCDTCON5	LCD Timing Control Register5	Read/Write	0xFFFF0_80C0
LCDTCON6	LCD Timing Control Register6	Read	0xFFFF0_80C4
<b>LCD SRAM Build In Self Test</b>			
BIST	Palette SRAM Build In Self Test Register	Read/Write	0xFFFF0_80D0
<b>Look Up Table SRAM</b>			
		Read/Write	0xFFFF0_0100
			...
			0xFFFF0_84FF

7.10.3 LCD Special Register Description

7.10.3.1. LCD Controller

**LCD Controller Control Register (LCDCON)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LCDCON	0xFFFF0_8000	R/W	LCD Controller control register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved						PPRST	LCDRST
23	22	21	20	19	18	17	16
Reserved			YUV_nRGB	OSDEN	LUTWREN	LUTEN	LCDCEN
15	14	13	12	11	10	9	8
Reserved		YUV_SEQ		RGBSEQ		LCDBUS	
7	6	5	4	3	2	1	0
TVEN	LCDMON8	TFTTYPE	LCDTFT	LCDBW	LCDBPP		

BITS	DESCRIPTIONS	
[31:26]	Reserved	Reserved
[25]	PPRST	LCD Pre-Processor Reset 0 = Disable, normal operation 1 = Only reset the LCD Pre-Processor, clear FIFO, AHB protocol re-start.
[24]	LCDRST	LCD Controller Reset(except Control Registers) 0 = Disable, normal operation 1 = Reset the whole LCD Controller include LCD Timing Generator
[23:21]	Reserved	Reserved
[20]	YUV_nRGB	Image stored in memory device is YUV format or RGB format 0 = RGB format 1 = YUV format If this bit is set to 1, LCDBPP must be set to 101 ( 16bpp )
[19]	OSDEN	OSD Data Fetch Control 0 = Disable 1 = Enable

Continued.

BITS	DESCRIPTIONS	
[18]	LUTWREN	Look Up Table SRAM Read/Write Enable 0 = Disable 1 = Enable
[17]	LUTEN	Look Up Table Enable 0 = Disable 1 = Enable
[16]	LCDCEN	LCD Controller Enable 0 = Disable VSYNC, HSYNC, VCLK, VD, and VDEN 1 = Enable VSYNC, HSYNC, VCLK, VD, and VDEN
[15:14]	Reserved	Reserved
[13:12]	YUV_SEQ	YUV output sequence( only used at TV-Encoder) 00 = UYVY 01 = YUYV 10 = VYUY 11 = YVYU
[11:10]	RGBSEQ	LCD Line Data Sequence( only used at Sync-Type non High Color TFT) 00 = First line data is RGB, second line data is GBR 01 = First line data is BGR, second line data is RBG 10 = First line data is GBR, second line data is RGB 11 = First line data is RBG, second line data is BGR
[9:8]	LCDBUS	Video Data output re-map( Only used at Sync-type High Color TFT) 00 = Data bus is 24bit 01 = Data bus is 18bit 10 = Data bus is 8bit
[7]	TVEN	External TV encoder Enable 0 = Normal operation 1 = Convert RGB to YCbCr for external TV encoder
[6]	LCDMON8	Monochrome LCD has an 8-bit interface 0 = mono LCD use 4-bit interface 1 = mono LCD uses 8-bit interface

Continued.

BITS	DESCRIPTIONS	
[5]	TFTTYPE	TFT Type Select 0 = Sync-type High Color TFT LCD 1 = Sync-type TFT LCD
[4]	LCDTFT	LCD is TFT 0 = LCD is a STN display 1 = LCD is a TFT display
[3]	LCDBW	STN LCD is monochrome 0 = STN LCD is color 1 = STN LCD is monochrome
[2:0]	LCDBPP	LCD bits per pixel 011 = 8 bpp RGB332 100 = 12 bpp RGB444 101 = 16 bpp RGB565 110 = 18 bpp RGB666

**NOTE:** LCDBPP means the resolution (Bit Per-Pixel) of the image data which store in memory device.

If LUTEN is enabled, LCD Controller will output data from Palette SRAM for 8bpp image. Else, LCD Controller will treat 8bpp data as RGB332.

At normally, Video Data bus output is RGB888, 24bit. If LCDBUS is set to 01, Video Data bus output is RGB666, 18bit. If LCDBUS is set to 10, Video Data bus output is RGB332, 8bit. The other bit will be replaced with zero. Please refer to GPIO chapter to setting this register.

### 7.10.3.2. LCD Interrupt Control

There are enable register, clear register, status register for every interrupt type. Enable Mask set/clear register will branch firmware into interrupt sub-routine. Firmware can read Status register to identify which interrupt generate now. Write Clear register will clear the interrupt status. Status register will be set even if firmware disable the Enable register. Main-routine can read Status register and write Clear register.

### LCD Interrupt Enable Register (LCDINTENB)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LCDINTENB	0xFFFFF0_0004	R/W	LCD interrupt enable register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved					UNDREN2	UNDREN1	AHBEREN
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		HSEN	VSEN	VLFINEN2	VFFINEN2	VLFINEN1	VFFINEN1

BITS	DESCRIPTIONS	
[31:19]	Reserved	Reserved
[18]	UNDREN2	FIFO2 UNDERRUN interrupt enable
[17]	UNDREN1	FIFO1 UNDERRUN interrupt enable
[16]	AHBEREN	AHB ERROR interrupt enable
[15:6]	Reserved	Reserved
[5]	HSEN	HSYNC interrupt enable
[4]	VSEN	VSYNC interrupt enable
[3]	VLFINEN2	FIFO2 VLINE FINISH interrupt enable
[2]	VFFINEN2	FIFO2 VFRAME FINISH interrupt enable
[1]	VLFINEN1	FIFO1 VLINE FINISH interrupt enable
[0]	VFFINEN1	FIFO1 VFRAME FINISH interrupt enable

### LCD Interrupt Status Register (LCDINTS)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LCDINTS	0xFFFF0_8008	R	LCD interrupt status register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved					UNDRIS2	UNDRIS1	AHBERIS
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		HSIS	VSIS	VLFINIS2	VFFINIS2	VLFINIS1	VFFINIS1

<b>BITS</b>	<b>DESCRIPTIONS</b>	
[31:20]	Reserved	Reserved
[18]	UNDRIS2	FIFO2 have no data for output to Panel
[17]	UNDRIS1	FIFO1 have no data for output to Panel
[16]	AHBERIS	AHB master bus error status
[15:6]	Reserved	Reserved
[5]	HSIS	Timing Generator output a HSYNC pulse
[4]	VSIS	Timing Generator output a VSYNC pulse
[3]	VLFINIS2	FIFO2 transfer one line stream complete
[2]	VFFINIS2	FIFO2 transfer one frame stream complete
[1]	VLFINIS1	FIFO1 transfer one line stream complete
[0]	VFFINIS1	FIFO1 transfer one frame stream complete

LCD Controller is an AHB Master at AMBA and fetching video data from an AHB Slave such as SDRAM or FLASH memory. If AHB Slave response ERROR for LCD Controller's data request, AHBERRIS will be set.

If the data rate of output to LCD Panel is too fast and the data rate of fetch data from AMBA is too slow; there are no data in FIFO for LCD Panel's request, UNDRISx will be set. LCD Timing Generation register need to be re-configured.

HSIS and VSIS provide information for firmware to know the status of LCD Panel.

VLFINISx and VFFINISx provide information for firmware to know how much data FIFO have fetched.

## LCD Interrupt Clear Register (LCDINTC)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LCDINTC	0xFFFF0_800C	W	LCD interrupt clear register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

BITS	DESCRIPTIONS	
[31:5]	Reserved	Reserved
[4:3]	VDHUP	Video Horizontal Up-scaling control 00=1x 01=2x 10=4x
[2:1]	VDVUP	Video Vertical Up-scaling control 00=1x 01=2x 10=4x
[0]	Reserved	Reserved

### OSD Down-Scaling Factor Register (OSDDNSCF)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
OSDDNSCF	0xFFF0_8018	R/W	OSD data Horizontal/Vertical down-	0x0000_0000

31	30	29	28	27	26	25	24
OSDVDNN							
23	22	21	20	19	18	17	16
OSDVDNM							
15	14	13	12	11	10	9	8
OSDHDNN							
7	6	5	4	3	2	1	0
OSDHDNM							

BITS	DESCRIPTIONS	
[31:24]	OSDVDNN	An 8-bit value specifies the numerator part (N) of the vertical down-scaling factor.
[23:16]	OSDVDNM	An 8-bit value specifies the numerator part (M) of the vertical down-scaling factor.
[15:8]	OSDHDNN	An 8-bit value specifies the numerator part (N) of the Horizontal down-scaling factor.
[7:0]	OSDHDNM	An 8-bit value specifies the numerator part (M) of the Horizontal down-scaling factor.

**Video Down-Scaling Factor Register (VDDNSCF)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
VDDNSCF	0xFFFF0_801C	R/W	Video data Horizontal/Vertical down-scaling factor	0x0000_0000

31	30	29	28	27	26	25	24
VDVDNN							
23	22	21	20	19	18	17	16
VDVDNM							
15	14	13	12	11	10	9	8
VDHDNN							
7	6	5	4	3	2	1	0
VDHDNM							

BITS	DESCRIPTIONS	
[31:24]	VDVDNN	An 8-bit value specifies the numerator part (N) of the vertical down-scaling factor.
[23:16]	VDVDNM	An 8-bit value specifies the numerator part (M) of the vertical down-scaling factor.
[15:8]	VDHDNN	An 8-bit value specifies the numerator part (N) of the Horizontal down-scaling factor.
[7:0]	VDHDNM	An 8-bit value specifies the numerator part (M) of the Horizontal down-scaling factor.

Up-Scaling or Down-Scaling, firmware can choose only one function of it. If both factor register is configured, the behavior of LCD Controller is undefined.

**7.10.3.4. LCD FIFOs Controller**

**LCD FIFO Control Register (FIFOCON)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFOCON	0xFFFF0_8020	R/W	LCD FIFOs controller register	0x0000_0000

### LCD FIFO1 Transfer Data Source Start Address Register (FIFO1SADDR)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO1SADDR	0xFFFF0_8030	R/W	FIFO1 transfer data source start address	0x0000_0000

31	30	29	28	27	26	25	24
FIFO1SADDR							
23	22	21	20	19	18	17	16
FIFO1SADDR							
15	14	13	12	11	10	9	8
FIFO1SADDR							
7	6	5	4	3	2	1	0
FIFO1SADDR							

BITS	DESCRIPTIONS	
[31:0]	FIFO1SADDR	These bits indicate the source address of the bank location for the LCD frame buffer in the system memory.

### LCD FIFO2 Transfer Data Source Start Address Register (FIFO2SADDR)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO2SADDR	0xFFFF0_8034	R/W	FIFO2 transfer data source start address	0x0000_0000

31	30	29	28	27	26	25	24
FIFO2SADDR							
23	22	21	20	19	18	17	16
FIFO2SADDR							
15	14	13	12	11	10	9	8
FIFO2SADDR							
7	6	5	4	3	2	1	0
FIFO2SADDR							

BITS	DESCRIPTIONS	
[31:0]	FIFO2SADDR	These bits indicate the source address of the bank location for the LCD frame buffer in the system memory.

### LCD FIFO1 Data Request Transfer Count Register (FIFO1DREQCNT)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO1DREQCNT	0xFFFF0_8038	R/W	FIFO1 transfer data count register	0x0000_0000

31	30	29	28	27	26	25	24
FIFO1COLCNT							
23	22	21	20	19	18	17	16
FIFO1COLCNT							
15	14	13	12	11	10	9	8
FIFO1ROWCNT							
7	6	5	4	3	2	1	0
FIFO1ROWCNT							

BITS	DESCRIPTIONS	
[31:16]	FIFO1COLCNT	These bits indicate the FIFO1 request count per-line of video
[15:0]	FIFO1ROWCNT	These bits indicate the FIFO1 request count per-frame of video

**LCD FIFO2 Data Request Transfer Count Register (FIFO2DREQCNT)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO2DREQCNT	0xFFFF0_803C	R/W	FIFO2 transfer data count register	0x0000_0000

31	30	29	28	27	26	25	24
FIFO2COLCNT							
23	22	21	20	19	18	17	16
FIFO2COLCNT							
15	14	13	12	11	10	9	8
FIFO2ROWCNT							
7	6	5	4	3	2	1	0
FIFO2ROWCNT							

BITS	DESCRIPTIONS	
[31:16]	FIFO2COLCNT	These bits indicate the FIFO2 request count per-line of video
[15:0]	FIFO2ROWCNT	These bits indicate the FIFO2 request count per-frame of video

**LCD FIFO1 Current Access Data Address Register (FIFO1CURADR)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO1CURADR	0xFFFF0_8040	R	FIFO1 current access data address register	0x0000_0000

31	30	29	28	27	26	25	24
FIFO1CURADR							
23	22	21	20	19	18	17	16
FIFO1CURADR							
15	14	13	12	11	10	9	8
FIFO1CURADR							
7	6	5	4	3	2	1	0
FIFO1CURADR							

BITS	DESCRIPTIONS	
[31:0]	FIFO1CURADR	Contains the approximate current FIFO1 access data address

**LCD FIFO2 Current Access Data Address Register (FIFO2CURADR)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO2CURADR	0xFF0_8044	R	FIFO2 current access data address register	0x0000_0000

31	30	29	28	27	26	25	24
FIFO2CURADR							
23	22	21	20	19	18	17	16
FIFO2CURADR							
15	14	13	12	11	10	9	8
FIFO2CURADR							
7	6	5	4	3	2	1	0
FIFO2CURADR							

BITS	DESCRIPTIONS	
[31:0]	FIFO2CURADR	Contains the approximate current FIFO2 access data address

**LCD FIFO1 Real Column Count Register (FIFO1REALCULCNT)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO1REALCULCNT	0xFFFF0_8048	R/W	FIFO1 real column count register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
FIFO1REALCOLCNT							
7	6	5	4	3	2	1	0
FIFO1REALCOLCNT							

BITS	DESCRIPTIONS	
[31:16]	Reserved	Reserved
[15:0]	FIFO1REALCOLCNT	These bits indicate the FIFO1 real column count per-frame of video

**LCD FIFO2 Real Column Count Register (FIFO2REALCULCNT)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
FIFO2REALCULCNT	0xFFFF0_804C	R/W	FIFO2 real column count register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
FIFO2REALCOLCNT							
7	6	5	4	3	2	1	0
FIFO2REALCOLCNT							

BITS	DESCRIPTIONS	
[31:16]	Reserved	Reserved
[15:0]	FIFO2REALCOLCNT	These bits indicate the FIFO2 real column count per-line of video

**7.10.3.5. Color Generation**

If the image is 8bpp (256 color) but connect to an 18bpp or higher resolution TFT-LCD Panel, Lookup Table can convert dull color become colorful. Take 8bpp image as example, there are still 256 colors but Lookup Table can convert a normal red to scarlet, claret, sienna or crimson.

**TFT Lookup Table Entry Index Register 1 (LUTENTRY1)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LUTENTRY1	0xFFFF0_8060	R/W	TFT: lookup table entry index register	0x0000_0000

31	30	29	28	27	26	25	24
LUTENTRY1							
23	22	21	20	19	18	17	16
LUTENTRY1							
15	14	13	12	11	10	9	8
LUTENTRY1							
7	6	5	4	3	2	1	0
LUTENTRY1							

BITS	DESCRIPTIONS	
[31:0]	LUTENTRY1	Theses bits define address of Palette SRAM when pixel data is 00 = LUTENTRY1[7:0] 01 = LUTENTRY1[15:8] 10 = LUTENTRY1[23:16] 11 = LUTENTRY1[31:24]

**TFT Lookup Table Entry Index Register 2 (LUTENTRY2)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LUTENTRY2	0xFFFF0_8064	R/W	TFT: lookup table entry index register	0x0000_0000

31	30	29	28	27	26	25	24
LUTENTRY2							
23	22	21	20	19	18	17	16
LUTENTRY2							
15	14	13	12	11	10	9	8
LUTENTRY2							
7	6	5	4	3	2	1	0
LUTENTRY2							

BITS	DESCRIPTIONS	
[31:0]	LUTENTRY2	These bits define address of Palette SRAM when pixel data is 00 = LUTENTRY2[7:0] 01 = LUTENTRY2[15:8] 10 = LUTENTRY2[23:16] 11 = LUTENTRY2[31:24]

**TFT Lookup Table Entry Index Register 3 (LUTENTRY3)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LUTENTRY3	0xFFFF0_8068	R/W	TFT: lookup table entry index register	0x0000_0000

31	30	29	28	27	26	25	24
LUTENTRY3							
23	22	21	20	19	18	17	16
LUTENTRY3							
15	14	13	12	11	10	9	8
LUTENTRY3							
7	6	5	4	3	2	1	0
LUTENTRY3							

BITS	DESCRIPTIONS	
[31:0]	LUTENTRY3	Theses bits define address of Palette SRAM when pixel data is 00 = LUTENTRY3[7:0] 01 = LUTENTRY3[15:8] 10 = LUTENTRY3[23:16] 11 = LUTENTRY3[31:24]

#### TFT Lookup Table Entry Index Register 4 (LUTENTRY4)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
LUTENTRY4	0xFFFF0_806C	R/W	TFT: lookup table entry index register	0x0000_0000

31	30	29	28	27	26	25	24
LUTENTRY4							
23	22	21	20	19	18	17	16
LUTENTRY4

BITS	DESCRIPTIONS	
[31:3]	Reserved	Reserved
[2]	FAIL	BIST Fail indicator 0 = SRAM BIST not fail 1 = SRAM BIST fail
[1]	FINISH	BIST Finish Status (Read Only) 0 = When BIST enabled, this value means BIST not finished 1 = When BIST enabled, this value means BIST finished, and FAIL can be referenced
[0]	BISTEN	BIST Mode Enable 0 = SRAM is in normal operation. 1 = BIST enabled, SRAM is under BIST test

## 7.11 Audio Controller

The audio controller consists of IIS/AC-link protocol to interface with external audio CODEC.

One 8-level deep FIFO for read path and write path and each level has 32-bit width (16 bits for right channel and 16 bits for left channel). One DMA controller handles the data movement between FIFO and memory.

The following are the property of the DMA.

- Always 8-beat incrementing burst
- Always bus lock when 8-beat incrementing burst
- When reach middle and end address of destination address, a DMA\_IRQ is requested to CPU automatically

An AHB master port and an AHB slave port are offered in audio controller.

### 7.11.1 IIS Interface

The IIS interface signals are shown as figure 7.11.2.1

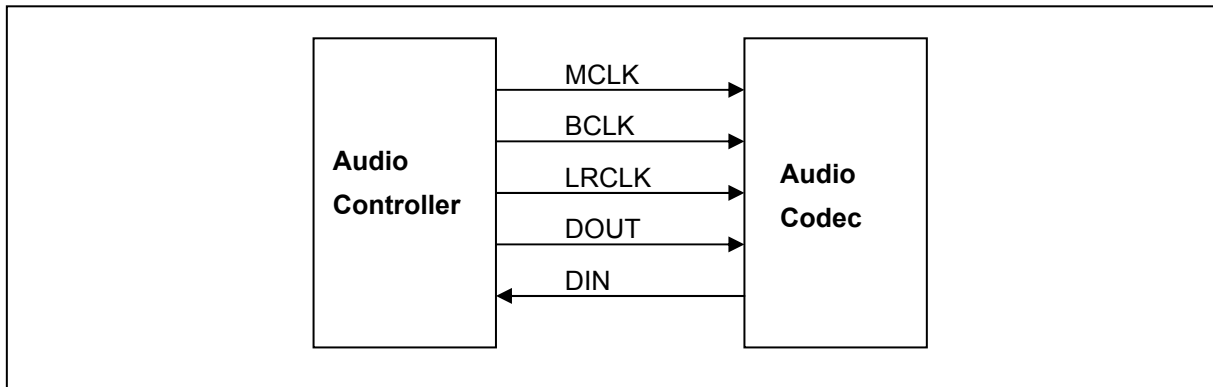

Figure 7.11.2.1 The interface signal of IIS

The 16 bits IIS and MSB-justified format are support, the timing diagram is shown as Figure 7.11.2.2

Figure 7.11.2.2 The format of IIS

The sampling rate, bit shift clock frequency could be set by the control register ACTL\_IISCON.

### 7.11.2 AC97 Interface

The AC97 interface, called AC-link is supported. For input and output direction, each frame contains a Tag slot and 12 data slots. However, in the 12 data slots, **only 4 slots are used in W90P710**, other 8 slots are not supported, and the control data and audio data are transferred in the 4 valid slots. Each slot contains 20 bits data.

The interface signals are shown as Figure 7.11.2.1

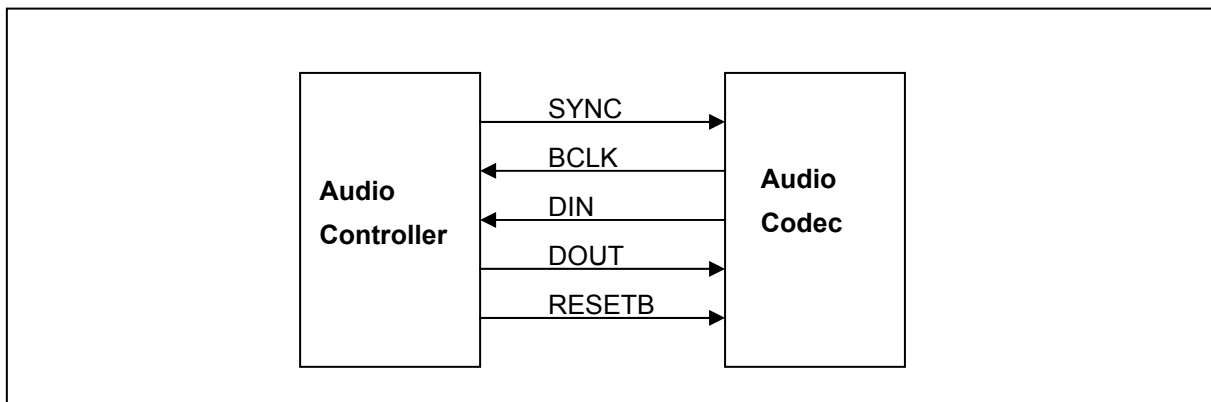

Figure 7.11.2.1 The interface signal of AC-link

The signal format is shown as Figure 7.11.2.2

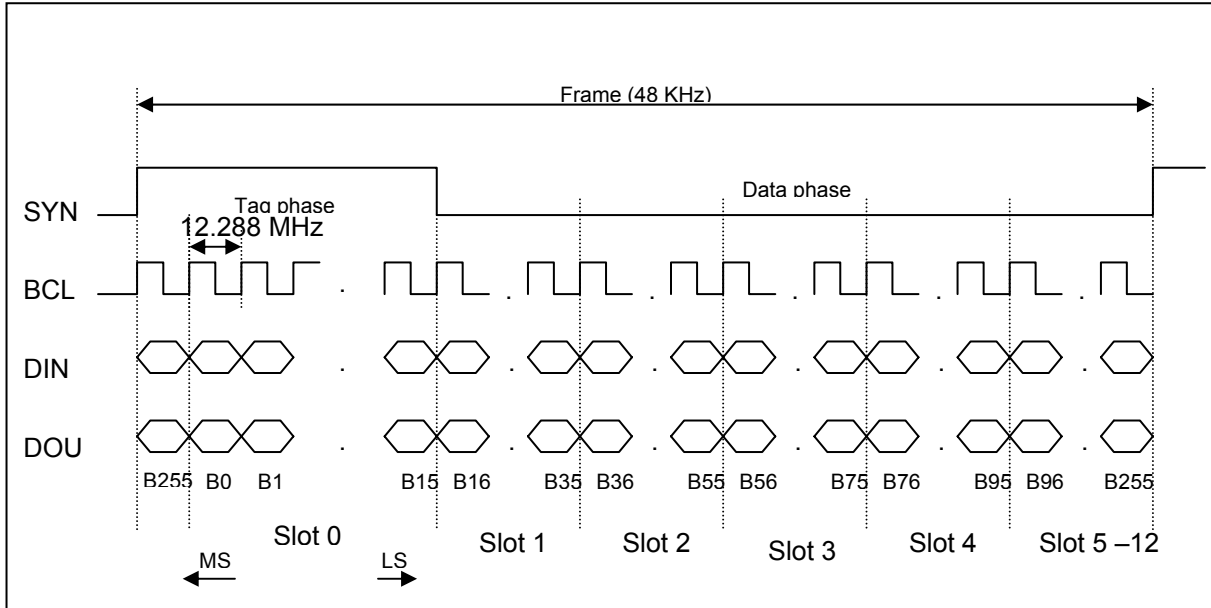

Figure 7.11.2.2 The signal format of AC-link

The structure of **output frame** is shown as below:

SLOT #	0	1	2	3	4	5	6	7	8	9	10	11	12
CONTENT	Tag	CMD ADDR	CMD DATA	PCM LEFT	PCM RIGHT	Unused							
BITS	15-0	19-0	19-0	19-0	19-0	159 - 0							
PHASE	Tag phase	Data phase											

The output frame data format is shown as following:

SLOT #	BIT	DESCRIPTION
Tag (slot 0)	15	Frame validity bit, 1 is valid, 0 is invalid.
	14 - 3	Slot validity, but in W90P710, only bits 6-3 are used, bits 14-7 are unused. Bit 3 is corresponding to slot 1, bit 4 is corresponding to slot 2, etc.. 1 is valid, 0 is invalid. The unused bits 14-7 should be cleared to 0.
	2 - 0	This field should be cleared to 0.

Continued.

SLOT #	BIT	DESCRIPTION
<b>CMD ADDR</b> (slot 1)	19	Read/write control, 1 for read and 0 for write
	18-12	Control register address
	11 - 0	This field should be cleared to 0
<b>CMD DATA</b> (slot 2)	19 - 4	Control register write data. It should be cleared to 0 if current operation is read.
	3 - 0	This field should be cleared to 0
<b>PCM LEFT</b> (slot 3)	19 - 4	PCM playback data for left channel
	3 - 0	This field should be cleared to 0
<b>PCM RIGHT</b> (slot 4)	19 - 4	PCM playback data for right channel
	3 - 0	This field should be cleared to 0

The structure of **input frame** is shown as below:

Slot #	0	1	2	3	4	5	6	7	8	9	10	11	12
<b>Content</b>	Tag	status ADDR	status DATA	PCM LEFT	PCM RIGHT	<b>Unused</b>							
<b>Bits</b>	0-15	19-0	19-0	19-0	19-0	159 - 0							

The input frame data format is shown as following:

SLOT #	BIT	DESCRIPTION
<b>Tag</b> (slot 0)	15	Frame validity bit, 1 is valid, 0 is invalid.
	14 - 3	Slot validity, but in W90P710, only bits 6-3 are used, bits 14-7 are unused. Bit 3 is corresponding to slot 1, bit 4 is corresponding to slot 2, etc.. 1 is valid, 0 is invalid. The unused bits 14-7 should be cleared to 0.
	2 - 0	This field should be cleared to 0.
<b>Status ADDR</b> (slot 1)	19	This bit should be cleared to 0
	18-12	Control register address echo which previous frame requested
	11	PCM data for left channel request, it should be always 0 when VRA=0 (VRA: Variable Rate Audio mode).
	10	PCM data for right channel request (Same as Bit 11).
	9 - 0	This field should be cleared to 0
<b>Status DATA</b> (slot 2)	19 - 4	Control register read data which previous frame requested. It should be cleared to 0 if this slot is invalid.
	3 - 0	This field should be cleared to 0

Continued

SLOT #	BIT	DESCRIPTION
<b>PCM LEFT</b> <b>(slot 3)</b>	19 - 4	PCM record data for left channel
	3 - 0	This field should be cleared to 0
<b>PCM RIGHT</b> <b>(slot 4)</b>	19 - 4	PCM record data for right channel
	3 - 0	This field should be cleared to 0

### 7.11.3 Audio Controller Register Map

R: read only, W: write only, R/W: both read and write, C: Only value 0 can be written

BITS	DESCRIPTIONS	
[6]	Reserved	-
[5]	AC_BCLK_PU_EN	This bit controls the AC_BCLK pin pull-high resistor. AC_BCLK_PU_EN=0, the AC_BCLK pin pull-high resistor will be disabled AC_BCLK_PU_EN=1, the AC_BCLK pin pull-high resistor will be enabled The AC_BCLK_PU_EN bit is read/write.
[4]	AC_R_FINISH	AC-link read data ready bit. When read data indexed by previous frame is shifted into ACTL_ACIS2, the AC_R_FINISH bit will be set to 1 automatically. After CPU read out the read data, AC_R_FINISH bit will be cleared to 0. AC_R_FINISH=0, read data buffer has been read by CPU AC_R_FINISH=1, read data buffer is ready for CPU read The AC_R_FINISH bit is read only
[3]	AC_W_FINISH	AC-link write frame finish bit. When writing data to register ACTL_ACOS0, the AC_W_FINISH bit will be set to 1 automatically. After AC-link interface shift out the register ACTL_ACOS0, the AC_W_FINISH bit will be cleared to 0. AC_W_FINISH=0, AC-link control data out buffer has been shifted out to codec by CPU and data out buffer is empty. AC_W_FINISH=1, AC-link control data out buffer is ready to be shifted out(After users have wrote data into register ACTL_ACOS0) The AC_W_FINISH bit is read only

Continued.

BITS	DESCRIPTIONS	
[2]	AC_W_RES	AC-link warm reset control bit, when this bit is set to 1, (AC-link begin warm reset procedure, after warm reset procedure finished, this bit will be cleared automatically) the interface signal AC_SYNC is high, when this bit is set to 0, the interface signal AC_SYNC is controlled by AC_BCLK input when this bit is set to 1. Note the AC-link spec. shows it need at least 10 us high duration of AC_SYNC to warm reset AC97. AC_W_RES=0, AC_SYNC pin is controlled by AC_BCLK input pin AC_W_RES=1, AC_SYNC pin is forced to high The AC_W_RES bit is read/write
[1]	AC_C_RES	AC-link cold reset control bit, when this bit is set to 1, the interface signal AC_RESETB is low, when this bit is set to 0, the signal AC_RESETB is high. Note the AC-link spec. shows it need at least 10 us low duration of AC_RESETB to cold reset AC97. AC_C_RES=0, AC_RESETB pin is set to 1 AC_C_RES=1, AC_RESETB pin is set to 0 The AC_C_RES bit is read/write
[0]	Reserved	-

### AC-link output slot 0 (ACTL\_ACOS0)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
ACTL_ACOS0	0xFFFF0_9030	R/W	AC-link out slot 0	0x0000_0000

The ACTL\_ACOS0 register store the slot 0 value to be shift out by AC-link. Note that write data to ACTL\_ACOS0 register when AC\_W\_FINISH bit (ACTL\_ACCON[3]) is set is invalid. Therefore, **check AC\_W\_FINISH bit status before write data into ACTL\_ACOS0 register.**

## 7.12 Universal Asynchronous Receiver/Transmitter Controller

Asynchronous serial communication block include 4 **UART** blocks and accessory logic. They can be described as follow:

- **UART0**

It is merely a general purpose UART. It does not include any accessory function.

Clock Source	: 15MHz
UART Type	: general UART, it is same as the UART of W90N740
FIFO Number	: 16-byte receiving FIFO and 16 byte transmitting FIFO
Modem Function	: N/A
Accessory Function	: N/A

- **UART1**

It is designed for general purpose UART or Bluetooth transceiver. It includes a high speed UART block with 64-byte receiving FIFO and 64-byte transmitting FIFO. It includes 3 clock sources: 15M, 30M, and 43.6M. Programmer can feel free to choose the clock source and divisor number for suitable baud rate.

Clock Source	: 15MHz from external crystal 30M, 43.6M, 48M, 60M (optional function for Bluetooth HCI transport layer)
UART Type	: high speed UART, it is same as the UART of W99702
FIFO Number	: 64-byte receiving FIFO and 64 byte transmitting FIFO
Modem Function	: CTS and RTS (optional for Bluetooth. If they were enabled, TX & RX in UART2 will be cut off)
Accessory Function	: Bluetooth (optional)
Baud Rate (max)	: 1.875MHz
I/O pin	: TXD1, RXD1, RTS, CTS (optional)

- **UART2**

It is designed for general purpose UART or IrDA SIR. The part of UART includes 16-byte receiving FIFO and 16-byte transmitting FIFO. The UART is same as the UART of W90N740 but without modem function. The U3 block has merely 2 I/O. TXD2/RXD2 of UART2 occupy the same pins with RTS and CTS of UART1. Once the Bluetooth function has been enabled, UART2 should be disabled.

Clock Source	: 15MHz
UART Type	: general UART, it is same as the UART of W90N740
FIFO Number	: 16-byte receiving FIFO and 16 byte transmitting FIFO
Modem Function	: N/A

Accessory Function : IrDA SIR (optional)  
 I/O Pin : TXD2, RXD2.  
 I/O Pin Share with : UART1 (Bluetooth function)

- **UART3**

It is also merely a general purpose UART. It does not include any accessory function. It share four I/O pins with AC97/I2S.

Clock Source : 15MHz  
 UART Type : general UART, it is same as the UART of W90N740  
 FIFO Number : 16-byte receiving FIFO and 16 byte transmitting FIFO  
 Modem Function : DTR, DSR  
 Accessory Function : N/A  
 I/O Pin : TXD3, RXD3, DTR, DSR  
 I/O Pin Share with : AC97\_DATAO, AC97\_DATAI, AC97\_SYNC, AC97\_BITCLK

**Table 7.12.1 W90P710 UART features list**

BLOCK NUMBER	UART TYPE	CLOCK SOURCE	MODEM FUNCTION SIGNALS	IO PINS	DESIGN TARGET
0	General UART	15M	N/A	TxD0, RXD0	General UART
1	High speed UART	15M, 30M, 43.6M, 48M, 60M	CTS, RTS	TXD1, RXD1, CTS1, RTS1	General UART/ Bluetooth
2	General UART	15M	N/A	TX2, RX2	General UART/IrDA SIR
3	General UART	15M	DTR, DSR	TXD3, RXD3, DRT3, DSR3	General UART

### 7.12.1 UART0

UART0 is a general UART block. It is same as the UART in W90N740 but without Modem I/O signals. More detail function description, please refer to section 7.12.5 **General UART controller description**

**Table 7.12.1.1 UART0 Register Map**

REGISTER	ADDRESS	R/W	OTHER CONDITION	RESET VALUE
UART0_RBR	0xFFFF8_0000	R	DLAB=0	Undefined

Reserved	0xFFFF8_0018			
UART0_TOR	0xFFFF8_001c	R/W		0x0000_0000

### 7.12.2 UART1

The UART1 is designed for general purpose UART or Bluetooth HCI transport layer. It is a high speed UART with 64-byte receive FIFO and 64-byte transmit FIFO. To perform 1.875MHz maximum baud rate, UART1 has 5 clock sources, 15M, 30M, 43.6M, 48M, and 60M. The first one is from external 15M crystal clock and the other are divided from system PLL 480MHz output. More detail about high speed UART, please refer to next section 7.12.6 **High Speed UART controller function description**.

The block UART1 offer 4 I/O signals, TX, RX, CTS, and RTS. CTS and RTS are used as flow control for Bluetooth. CTS and RTS share the same I/O pins with TX and RX in block UART2.

Table 7.12.2.1 UART1 Register Map

REGISTER	ADDRESS	R/W	OTHER CONDITION	RESET VALUE
UART1_RBR	0xFFF8_0100	R	DLAB=0	Undefined

BITS	DESCRIPTIONS	
[31:3]	Reserved	-
[2:0]	UBCR	UBCR is a 3 bits register which is used to select clock source to generate suitable baud rate: 000: 15Mhz from external crystal 100: 30Mhz divided from PLL 480Mhz 101: 43.6Mhz divided from PLL 480Mhz 110: 48Mhz divided from PLL 480Mhz 111: 60Mhz divided from PLL 480Mhz

### 7.12.3 UART2

UART2 contains 2 features: general UART and IrDA SIR decoder/encoder. UART is same as the UART of W90N740 but without modem function. Please read the spec of section 7.12.5 **General UART controller function description**. The IrDA SIR is described as follow:

**Table 7.12.3.1 UART2 Register Map**

Register	Address	R/W	Other condition	Reset value

## 7.12.4 UART3

UART3 is a general UART block. It is same as the UART in W90N740 but with some Modem I/O signals.

More detail general UART function description, please refer to next section 7.12.5 General UART controller.

**Table 7.12.4.1 UART3 register map**

REGISTER	ADDRESS	R/W	OTHER CONDITION	RESET VALUE
UART3_RBR	0xFFF8_0300	R	DLAB=0	Undefined
UART3_THR	0xFFF8_0300	W	DLAB=0	Undefined
UART3_IER	0xFFF8_0304	R/W	DLAB=0	0x0000_0000
UART3_DLL	0xFFF8_0300	R/W	DLAB=1	0x0000_0000

Reserved	Reserved	DSR#	Reserved	Reserved	Reserved	DDSR	Reserved

**Note:** MSR is subset of MSR in W90N740. Please refer to section 7.13.5 'General UART'.

#### 7.12.5 General UART Controller

The **Universal Asynchronous Receiver/Transmitter (UART)** performs a serial-to-parallel conversion on data characters received from the peripheral such as MODEM, and a parallel-to-serial conversion on data characters received from the CPU. There are five types of interrupts, i.e., **line status interrupt, transmitter FIFO empty interrupt, receiver threshold level reaching interrupt, time out interrupt, and MODEM status interrupt**. One 16-byte transmitter FIFO (**TX\_FIFO**) and one 16-byte (plus 3-bit of error data per byte) receiver FIFO (**RX\_FIFO**) has been built in to reduce the number of interrupts presented to the CPU. The CPU can completely read the status of the UART at any time during the operation. The reported status information includes the type and condition of the transfer operations being performed by the UART, as well as any error conditions (parity, overrun, framing, or break interrupt) found. The UART includes a programmable baud rate generator that is capable of dividing crystal clock input by divisors to produce the clock that transmitter and receiver needed. The equation is

$$\text{BaudOut} = \text{crystal clock} / 16 * [\text{Divisor} + 2].$$

The UART includes the following features:

- Transmitter and receiver are buffered with a 16-byte FIFO each to reduce the number of interrupts presented to the CPU.
- **Subset of MODEM control functions (DSR, DTR, by IP selection)**
- Fully programmable serial-interface characteristics:
  - 5-, 6-, 7-, or 8-bit character
  - Even, odd, or no-parity bit generation and detection
  - 1-, 1&1/2, or 2-stop bit generation

- Baud rate generation
- Line break generation and detection
- False start bit detection
- Full prioritized interrupt system controls
- Loop back mode for internal diagnostic testing

#### 7.12.5.1. UART Control Registers Map

**R:** read only, **W:** write only, **R/W:** both read and write, **C:** Only value 0 can be written

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_RBR	0x00	R	Receive Buffer Register (DLAB = 0)	Undefined
UART_THR	0x00	W	Transmit Holding Register (DLAB = 0)	Undefined
UART_IER	0x04	R/W	Interrupt Enable Register (DLAB = 0)	0x0000_0000
UART_DLL	0x00	R/W	Divisor Latch Register (LS) (DLAB = 1)	0x0000_0000
UART_DLM	0x04	R/W	Divisor Latch Register (MS) (DLAB = 1)	0x0000_0000
UART_IIR	0x08	R	Interrupt Identification Register	0x8181_8181
UART_FCR	0x08	W	FIFO Control Register	Undefined
UART_LCR	0x0C	R/W	Line Control Register	0x0000_0000
UART_MCR	0x10	R/W	Modem Control Register (Optional)	0x0000_0000
UART_LSR	0x14	R	Line Status Register	0x6060_6060
UART_MSR	0x18	R	MODEM Status Register (Optional)	0x0000_0000
UART_TOR	0x1C	R/W	Time Out Register	0x0000_0000

**Note:** Real register address =  $0xFFF8\_0000 + (\text{UART number} - 1) * (0x0100) + \text{offset}$

**Note:** All of these registers are implemented 8-bit in UART design and it will be repeated 4 times before send to APB bus. For example, when ARM CPU read register UARTn\_BRR, ARM CPU will get UART0\_RBR = {RBR[7:0], RBR[7:0], RBR[7:0], RBR[7:0]}.

#### UART Receive Buffer Register (UART\_RBR)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_RBR	0x00	R	Receive Buffer Register (DLAB = 0)	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
8-bit Received Data							

BITS	DESCRIPTIONS	
[7:0]	<b>8-bit Received Data</b>	By reading this register, the UART will return an 8-bit data received from SIN pin (LSB first).

#### UART Transmit Holding Register (UART\_THR)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_THR	0x00	W	Transmit Holding Register (DLAB = 0)	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
8-bit Transmitted Data							

BITS	DESCRIPTIONS	
[7:0]	<b>8-bit Transmitted Data</b>	By writing to this register, the UART will send out an 8-bit data through the SOUT pin (LSB first).

### UART Interrupt Enable Register (UART\_IER)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_IER	0x04	R/W	Interrupt Enable Register (DLAB = 0)	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RESERVED			nDBGACK_EN	MSIE	RLSIE	THREIE	RDAIE

BITS	DESCRIPTIONS	
[31:5]	Reserved	-
[4]	nDBGACK_EN	<b>ICE debug mode acknowledge enable</b> 0 = When DBGACK is high, the UART receiver time-out clock will be held 1 = No matter what DBGACK is high or not, the UART receiver timer-out clock will not be held
[3]	MSIE	<b>MODEM Status Interrupt (Irpt_MOS) Enable</b> 0 = Mask off Irpt_MOS 1 = Enable Irpt_MOS
[2]	RLSIE	<b>Receive Line Status Interrupt (Irpt_RLS) Enable</b> 0 = Mask off Irpt_RLS 1 = Enable Irpt_RLS
[1]	THREIE	<b>Transmit Holding Register Empty Interrupt (Irpt_THRE) Enable</b> 0 = Mask off Irpt_THRE 1 = Enable Irpt_THRE
[0]	RDAIE	<b>Receive Data Available Interrupt (Irpt_RDA) Enable and Time-out Interrupt (Irpt_TOUT) Enable</b> 0 = Mask off Irpt_RDA and Irpt_TOUT 1 = Enable Irpt_RDA and Irpt_TOUT

### UART Divider Latch (Low Byte) Register (UART\_DLL)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_DLL	0x00	R/W	Divisor Latch Register (LS) (DLAB = 1)	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Baud Rate Divider (Low Byte)							

BITS	DESCRIPTIONS	
[7:0]	Baud Rate Divider (Low Byte)	The low byte of the baud rate divider

### UART Divisor Latch (High Byte) Register (UART\_DLM)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_DLM	0x04	R/W	Divisor Latch Register (MS) (DLAB = 1)	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Baud Rate Divider (High Byte)							

BITS	DESCRIPTIONS	
[7:0]	Baud Rate Divider (High Byte)	The high byte of the baud rate divider

This 16-bit divider {DLM, DLL} is used to determine the baud rate as follows

$$\text{Baud Rate} = \text{Crystal Clock} / \{16 * [\text{Divisor} + 2]\}$$

**Note:** This definition is different from 16550

**UART Interrupt Identification Register (UART\_IIR)**

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_IIR	0x08	R	Interrupt Identification Register	0x8181_8181

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
FMES	RFTLS		DMS	IID			NIP

BITS		DESCRIPTIONS
[7]	FMES	<b>FIFO Mode Enable Status</b> This bit indicates whether the FIFO mode is enabled or not. Since the FIFO mode is always enabling, this bit always shows the logical 1 when CPU is reading this register.
[6:5]	RFTLS	<b>RX FIFO Threshold Level Status</b> These bits show the current setting of receiver FIFO threshold level (RTHO). The meaning of RTHO is defined in the following FCR description.
[4]	DMS	<b>DMA Mode Select</b> The DMA function is not implemented in this version. When reading IIR, the DMS is always returned 0.
[3:1]	IID	<b>Interrupt Identification</b> The IID together with NIP indicates the current interrupt request from UART
[0]	NIP	<b>No Interrupt Pending</b> There is no pending interrupt.

Table 7.12.5.1 Interrupt Control Functions

IIR [3:0]	PRIORITY	INTERRUPT TYPE	INTERRUPT SOURCE	INTERRUPT RESET CONTROL
---1	--	None	None	--
0110	Highest	Receiver Line Status (Irpt_RLS)	Overrun error, parity error, framing error, or break interrupt	Reading the LSR
0100	Second	Received Data Available (Irpt_RDA)	Receiver FIFO threshold level is reached	Receiver FIFO drops below the threshold level
1100	Second	Receiver FIFO Time-out (Irpt_TOUT)	Receiver FIFO is non-empty and no activities are occurred in the receiver FIFO during the TOR defined time duration	Reading the RBR
0010	Third	Transmitter Holding Register Empty (Irpt_THRE)	Transmitter holding register empty	Reading the IIR (if source of interrupt is Irpt_THRE) or writing into the THR
0000	Fourth	MODEM Status (Irpt_MOS)	The CTS, DSR, or DCD bits are changing state or the RI bit is changing from high to low.	Reading the MSR <b>(optional)</b>

Note: These definitions of bit 7, bit 6, bit 5, and bit 4 are different from the 16550

### UART FIFO Control Register (UART\_FCR)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_FCR	0x08	W	FIFO Control Register	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RFITL		RESERVED		DMS	TFR	RFR	FME

BITS		DESCRIPTIONS	
[7:6]	RFITL	<b>RX FIFO Interrupt (lrpt_RDA) Trigger Level</b>	
		<b>RFITL [7:6]</b>	<b>lrpt_RDA Trigger Level (Bytes)</b>
		00	01
		01	04
		10	08
		11	14
[3]	DMS	<b>DMA Mode Select</b> The DMA function is not implemented in this version.	
[2]	TFR	<b>TX FIFO Reset</b> Setting this bit will generate an OSC cycle reset pulse to reset TX FIFO. The TX FIFO becomes empty (TX pointer is reset to 0) after such reset. This bit is returned to 0 automatically after the reset pulse is generated.	
[1]	RFR	<b>RX FIFO Reset</b> Setting this bit will generate an OSC cycle reset pulse to reset RX FIFO. The RX FIFO becomes empty (RX pointer is reset to 0) after such reset. This bit is returned to 0 automatically after the reset pulse is generated.	
[0]	FME	<b>FIFO Mode Enable</b> Because UART is always operating in the FIFO mode, writing this bit has no effect while reading always gets logical one. This bit must be 1 when other FCR bits are written to; otherwise, they will not be programmed.	

### UART Line Control Register (UART\_LCR)

Register	Offset	R/W	Description	Reset Value
UART_LCR	0x0C	R/W	Line Control Register	0x0000_0000

[4]	LBME	<p><b>Loop-back Mode Enable</b></p> <p>0 = Disable</p> <p>1 = When the loop-back mode is enabled, the following signals are connected internally</p> <p>SOUT connected to SIN and SOUT pin fixed at logic 1</p> <p>DTR# connected to DSR# and DTR# pin fixed at logic 1</p>
[3:1]	Reserved	-
[0]	DTR	<p><b>Complement version of DTR# (Data-Terminal-Ready) signal</b></p> <p>Writing 0x00 to MCR, the DTR# bit are set to logic 1's;</p> <p>Writing 0x0f to MCR, the DTR# bit are reset to logic 0's.</p>

### UART Line Status Control Register (UART\_LSR)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_LSR	0x14	R	Line Status Register	0x6060_6060

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
ERR_RX	TE	THRE	BII	FEI	PEI	OEI	RFDR

BITS	DESCRIPTIONS	
[31:8]	Reserved	-
[7]	ERR_RX	<p><b>RX FIFO Error</b></p> <p>0 = RX FIFO works normally</p> <p>1 = There is at least one parity error (PE), framing error (FE), or break indication (BI) in the FIFO. ERR_RX is cleared when CPU reads the LSR and if there are no subsequent errors in the RX FIFO.</p>
[6]	TE	<p><b>Transmitter Empty</b></p> <p>0 = Either Transmitter Holding Register (THR - TX FIFO) or Transmitter Shift Register (TSR) are not empty.</p> <p>1 = Both THR and TSR are empty.</p>
[5]	THRE	<p><b>Transmitter Holding Register Empty</b></p> <p>0 = THR is not empty.</p> <p>1 = THR is empty.</p> <p>THRE is set when the last data word of TX FIFO is transferred to Transmitter Shift Register (TSR). The CPU resets this bit when the THR (or TX FIFO) is loaded. This bit also causes the UART to issue an interrupt (Irpt_THRE) to the CPU when IER [1]=1.</p>
[4]	BII	<p><b>Break Interrupt Indicator</b></p> <p>This bit is set to a logic 1 whenever the received data input is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "start bit" + data bits + parity + stop bits) and is reset whenever the CPU reads the contents of the LSR.</p>
[3]	FEI	<p><b>Framing Error Indicator</b></p> <p>This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as a logic 0), and is reset whenever the CPU reads the contents of the LSR.</p>

Continued.

BITS		DESCRIPTIONS
[2]	PEI	<b>Parity Error Indicator</b> This bit is set to logic 1 whenever the received character does not have a valid "parity bit", and is reset whenever the CPU reads the contents of the LSR.
[1]	OEI	<b>Overrun Error Indicator</b> An overrun error will occur only after the RX FIFO is full and the next character has been completely received in the shift register. The character in the shift register is overwritten, but it is not transferred to the RX FIFO. OE is indicated to the CPU as soon as it happens and is reset whenever the CPU reads the contents of the LSR.
[0]	RFDR	<b>RX FIFO Data Ready</b> 0 = RX FIFO is empty 1 = RX FIFO contains at least 1 received data word.

LSR [4:2] (BII, FEI, PEI) are revealed to the CPU when its associated character is at the top of the RX FIFO. These three error indicators are reset whenever the CPU reads the contents of the LSR.

LSR [4:1] (BII, FEI, PEI, OEI) are the error conditions that produce a "receiver line status interrupt" (Irpt\_RLS) when IER [2]=1. Reading LSR clears Irpt\_RLS. Writing LSR is a null operation (not suggested)

## UART Modem Status Register (UART\_MSR)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
UART_MSR	0x18	R	MODEM Status Register (Optional)	0x0000_0000

BITS	DESCRIPTIONS	
[31:8]	Reserved	-
[7]	TOIE	<b>Time Out Interrupt Enable</b> The feature of receiver time out interrupt is enabled when TOR [7] = IER[0] = 1.
[6:0]	TOIC	<b>Time Out Interrupt Comparator</b> The time out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word. Once the content of time out counter (TOUT_CNT) is equal to that of time out interrupt comparator (TOIC), a receiver time out interrupt (lrpt_TOUT) is generated if TOR [7] = IER [0] = 1. A new incoming data word or RX FIFO empty clears lrpt_TOUT.

### 7.12.6 High speed UART Controller

The **High Speed Universal Asynchronous Receiver/Transmitter (HS\_UART)** performs a serial-to-parallel conversion on data characters received from the peripheral, and a parallel-to-serial conversion on data characters received from the CPU. There are five types of interrupts, they are, transmitter FIFO empty interrupt, receiver threshold level reaching interrupt, line status interrupt (overrun error or parity error or framing error or break interrupt), time out interrupt, and Modem status interrupt. One 64-byte transmitter FIFO (**TX\_FIFO**) and one 64-byte (plus 3-bit of error data per byte) receiver FIFO (**RX\_FIFO**) has been built in to reduce the number of interrupts presented to the CPU. The CPU can completely read the status of the UART at any time during the operation. The reported status information includes the type and condition of the transfer operations being performed by the UART, as well as any error conditions (parity, overrun, framing, or break interrupt) found. The UART includes a programmable baud rate generator that is capable of dividing crystal clock input by divisors to produce the clock that transmitter and receiver needed. The equation is

$$\text{Baud Out} = \text{crystal clock} / 16 * [\text{Divisor} + 2].$$

The UART includes the following features:

- Transmitter and receiver are buffered with a 64-byte FIFO each to reduce the number of interrupts presented to the CPU.
- Subset of MODEM control function(selected by IP)
- Fully programmable serial-interface characteristics:
  - 5-, 6-, 7-, or 8-bit character
  - Even, odd, or no-parity bit generation and detection
  - 1-, 1&1/2, or 2-stop bit generation
  - Baud rate generation
- False start bit detection
- Full-prioritized interrupt system controls
- Not support Loop back mode

#### 7.12.6.1. High Speed UART Control Registers Map

**R:** read only, **W:** write only, **R/W:** both read and write, **C:** Only value 0 can be written

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
HSUART_RBR	0x00	R	Receive Buffer Register (DLAB = 0)	Undefined
HSUART_THR	0x00	W	Transmit Holding Register (DLAB = 0)	Undefined
HSUART_IER	0x04	R/W	Interrupt Enable Register (DLAB = 0)	0x0000_0000
HSUART_DLL	0x00	R/W	Divisor Latch Register (LS)(DLAB = 1)	0x0000_0000
HSUART_DLM	0x04	R/W	Divisor Latch Register (MS)(DLAB = 1)	0x0000_0000

Continued.

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE
HSUART_IIR	0x08	R	Interrupt Identification Register	0x8181_8181
HSUART_FCR	0x08	W	FIFO Control Register	Undefined
HSUART_LCR	0x0C	R/W	Line Control Register	0x0000_0000
HSUART_MCR	0x10	R/W	Modem Control Register <b>(Optional)</b>	0x0000_0000
HSUART_LSR	0x14	R	Line Status Register	0x6060_6060
HSUART_MSR	0x18	R	MODEM Status Register <b>(Optional)</b>	0x0000_0000
HSUART_TOR	0x1C	R/W	Time Out Register	0x0000_0000

**Note:** Real register address = 0xFFF8\_0000+ (UART number – 1) \* (0x0100) + offset

**NOTE:** All of these registers are implemented 8-bit in UART design and it will be repeated 4 times before send to APB bus. For example, when ARM CPU read register UART1\_BRR, ARM CPU will get UART1\_RBR = {RBR[7:0], \_RBR[7:0], RBR[7:0], RBR[7:0]}.

### HSUART Receive Buffer Register (HSUART\_RBR)

Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
ERR_RX	TE	THRE	BII	FEI	PEI	OEI	RFDR

BITS	DESCRIPTIONS	
[31:8]	Reserved	
[7]	ERR_RX	<b>RX FIFO Error</b> 0 = RX FIFO works normally 1 = There is at least one parity error (PE), framing error (FE), or break indication (BI) in the FIFO. ERR_RX is cleared when CPU reads the LSR and if there are no subsequent errors in the RX FIFO.
[6]	TE	<b>Transmitter Empty</b> 0 = Either Transmitter Holding Register (THR - TX FIFO) or Transmitter Shift Register (TSR) are not empty. 1 = Both THR and TSR are empty.

Continued.

BITS	DESCRIPTIONS	
[5]	<b>THRE</b>	<b>Transmitter Holding Register Empty</b> 0 = THR is not empty. 1 = THR is empty. THRE is set when the last data word of TX FIFO is transferred to Transmitter Shift Register (TSR). The CPU resets this bit when the THR (or TX FIFO) is loaded. This bit also causes the UART to issue an interrupt (Irpt_THRE) to the CPU when IER [1]=1.
[4]	<b>BII</b>	<b>Break Interrupt Indicator</b> This bit is set to a logic 1 whenever the received data input is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "start bit" + data bits + parity + stop bits) and is reset whenever the CPU reads the contents of the LSR.
[3]	<b>FEI</b>	<b>Framing Error Indicator</b> This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as a logic 0), and is reset whenever the CPU reads the contents of the LSR.
[2]	<b>PEI</b>	<b>Parity Error Indicator</b> This bit is set to logic 1 whenever the received character does not have a valid "parity bit", and is reset whenever the CPU reads the contents of the LSR.
[1]	<b>OEI</b>	<b>Overrun Error Indicator</b> An overrun error will occur only after the RX FIFO is full and the next character has been completely received in the shift register. The character in the shift register is overwritten, but it is not transferred to the RX FIFO. OE is indicated to the CPU as soon as it happens and is reset whenever the CPU reads the contents of the LSR.
[0]	<b>RFDR</b>	<b>RX FIFO Data Ready</b> 0 = RX FIFO is empty 1 = RX FIFO contains at least 1 received data word.

LSR [4:2] (BII, FEI, PEI) are revealed to the CPU when its associated character is at the top of the RX FIFO. These three error indicators are reset whenever the CPU reads the contents of the LSR.

LSR [4:1] (BII, FEI, PEI, OEI) are the error conditions that produce a "receiver line status interrupt" (Irpt\_RLS) when IER [2]=1. Reading LSR clears Irpt\_RLS. Writing LSR is a null operation (not suggested).

### HSUART Modem Status Register (HSUART\_MSR)

REGISTER	OFFSET	R/W	DESCRIPTION	RESET VALUE

15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
TOIE	TOIC						

BITS	DESCRIPTIONS	
[31:8]	Reserved	-
[7]	TOIE	<b>Time Out Interrupt Enable</b> The feature of receiver time out interrupt is enabled only when TOR [7] = IER[0] = 1.
[6:0]	TOIC	<b>Time Out Interrupt Comparator</b> The time out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word. Once the content of time out counter (TOUT_CNT) is equal to that of time out interrupt comparator (TOIC), a receiver time out interrupt (Irpt_TOUT) is generated if TOR [7] = IER [0] = 1. A new incoming data word or RX FIFO empty clears Irpt_TOUT.

## 7.13 Timer/Watchdog Controller

### 7.13.1 General Timer Controller

The timer module includes two channels, TIMER0 and TIMER1, which allow you to easily implement a counting scheme for use. The timer can perform functions like frequency measurement, event counting, interval measurement, clock generation, delay timing, and so on. The timer possesses features such as adjustable resolution, programmable counting period, and detailed information. The timer can generate an interrupt signal upon timeout, or provide the current value of count during operation.

The general TIMER Controller includes the following features

- AMBA APB interface compatible
- Two channels with a 8-bit prescale counter/24-bit down counter and an interrupt request each
- Independent clock source for each channel
- Maximum uninterrupted time =  $(1 / 25 \text{ MHz}) * (256) * (2^{24})$ , if TCLK = 25 MHz

### 7.13.2 Watchdog Timer

This bit is self-clearing.</p> <p>0 = No operation</p> <p>1 = Reset the contents of the Watchdog timer</p>

## 7.14 Advanced Interrupt Controller

An *interrupt* temporarily changes the sequence of program execution to react to a particular event such as power failure, watchdog timer timeout, transmit/receive request from Ethernet MAC Controller, and so on. The ARM7TDMI processor provides two modes of interrupt, the **Fast Interrupt (FIQ)** mode for critical session and the *Interrupt (IRQ)* mode for general purpose. The IRQ exception is occurred when the nIRQ input is asserted. Similarly, the FIQ exception is occurred when the nFIQ input is asserted. The FIQ has privilege over the IRQ and can preempt an ongoing IRQ. It is possible to ignore the FIQ and the IRQ by setting the F and I bits in the **current program status register (CPSR)**.

The W90P710 incorporates the **advanced interrupt controller (AIC)** that is capable of dealing with the interrupt requests from a total of 32 different sources. Currently, 31 interrupt sources are defined. Each interrupt source is uniquely assigned to an *interrupt channel*. For example, the watchdog timer interrupt is assigned to channel 1. The AIC implements a proprietary eight-level priority scheme that differentiates the available 31 interrupt sources into eight priority levels. Interrupt sources within the priority level 0 have the highest priority and the priority level 7 has the lowest. To work this scheme properly, you must specify a certain priority level to each interrupt source during power-on initialization; otherwise, the system shall behave unexpectedly. Within each priority level, interrupt source that is positioned in a lower channel has a higher priority. Interrupt source that is active, enabled, and positioned in the lowest channel within the priority level 0 is promoted to the FIQ. Interrupt sources within the priority levels other than 0 can petition for the IRQ. The IRQ can be preempted by the occurrence of the FIQ. Interrupt nesting is performed automatically by the AIC.

Though interrupt sources originated from the W90P710 itself are intrinsically high-level sensitive, the AIC can be configured as either low-level sensitive, high-level sensitive, negative-edge triggered, or positive-edge triggered to each interrupt source. When the W90P710 is put in the test mode, all interrupt sources must be configured as positive-edge triggered.

The advanced interrupt controller includes the following features:

- AMBA APB bus interface
- External interrupts can be programmed as either edge-triggered or level-sensitive
- External interrupts can be programmed as either low-active or high-active
- Has flags to reflect the status of each interrupt source
- Individual mask for each interrupt source
- Proprietary 8-level interrupt scheme to ease the burden from the interrupt
- Priority methodology is adopted to allow for interrupt daisy-chaining
- Automatically masking out the lower priority interrupt during interrupt nesting
- Automatically clearing the interrupt flag when the external interrupt source is programmed to be edge-triggered

## 7.14.1 Interrupt Sources

Table 7.14.1 W90P710 Interrupt Sources

PRIORITY	NAME	MODE	SOURCE

30	PS2_INT	Positive Level	PS2 Interrupt
31	IRQ45_INT	Positive Level	GPIO0 & GPIO70 Interrupt

## **AIC Functional Description**

---

### Hardware Interrupt Vectoring

The hardware interrupt vectoring can be used to shorten the interrupt latency. If not used, priority determination must be carried out by software. When the Interrupt Priority Encoding Register (AIC\_IPER) is read, it will return an integer representing the channel that is active and having the highest priority. This integer is equivalent to multiplied by 4 (shifted left two bits to word-align it) such that it may be used directly to index into a branch table to select the appropriate interrupt service routine vector.

### Priority Controller

An 8-level priority encoder controls the NIRQ line. Each interrupt source belongs to priority group between of 0 to 7. Group 0 has the highest priority and group 7 the lowest. When more than one unmasked interrupt channels are active at a time, the interrupt with the highest priority is serviced first. If all active interrupts have equal priority, the interrupt with the lowest interrupt source number is serviced first.

The current priority level is defined as the priority level of the interrupt with the highest priority at the time the register AIC\_IPER is read. In the case when a higher priority unmasked interrupt occurs while an interrupt already exists, there are two possible outcomes depending on whether the AIC\_IPER has been read.

- If the processor has already read the AIC\_IPER and caused the NIRQ line to be de-asserted, then the NIRQ line is reasserted. When the processor has enabled nested interrupts and reads the AIC\_IPER again, it reads the new, higher priority interrupt vector. At the same time, the current priority level is updated to the higher priority.
- If the AIC\_IPER has not been read after the NIRQ line has been asserted, then the processor will read the new higher priority interrupt vector in the AIC\_IPER register and the current priority level is updated.

When the End of Service Command Register (AIC\_EOSCR) is written, the current interrupt level is updated with the last stored interrupt level from the stack (if any). Therefore, at the end of a higher priority interrupt, the AIC returns to the previous state corresponding to the preceding lower priority interrupt which had been interrupted.

### Interrupt Handling

When the IRQ line is asserted, the interrupt handler must read the AIC\_IPER as soon as possible. This can de-assert the NIRQ request to the processor and clears the interrupt if it is programmed to be edge triggered. This allows the AIC to assert the NIRQ line again when a higher priority unmasked interrupt occurs.

The AIC\_EOSCR (End of Service Command Register) must be written at the end of the interrupt service routine. This permits pending interrupts to be serviced.

## Interrupt Masking

Each interrupt source, including FIQ, can be enabled or disabled individually by using the command registers AIC\_MECR and AIC\_MDCR. The status of interrupt mask can be read in the read only register AIC\_IMR. A disabled interrupt doesn't affect the servicing of other interrupts.

## Interrupt Clearing and Setting

All interrupt sources (including FIQ) can be individually set or clear by respectively writing to the registers AIC\_SSCR and AIC\_SCCR when they are programmed to be edge triggered. This feature of the AIC is useful in auto-testing or software debugging.

## Fake Interrupt

When the AIC asserts the NIRQ line, the processor enters interrupt mode and the interrupt handler reads the AIC\_IPER, it may happen that AIC de-asserts the NIRQ line after the processor has taken into account the NIRQ assertion and before the read of the AIC\_IPER.

This behavior is called a fake interrupt.

The AIC is able to detect these fake interrupts and returns all zero when AIC\_IPER is read. The same mechanism of fake interrupt occurs if the processor reads the AIC\_IPER (application software or ICE) when there is no interrupt pending. The current priority level is not updated in this situation. Hence, the AIC\_EOSCR shouldn't be written.

## ICE/Debug Mode

This mode allows reading of the AIC\_IPER without performing the associated automatic operations. This is necessary when working with a debug system. When an ICE or debug monitor reads the AIC user interface, the AIC\_IPER can be read. This has the following consequences in normal mode:

- If there is no enabled pending interrupt, the fake vector will be returned.
- If an enabled interrupt with a higher priority than the current one is pending, it will be stacked.

In the second case, an End-of-Service command would be necessary to restore the state of the AIC. This operation is generally not performed by the debug system. Therefore, the debug system would become strongly intrusive, and could cause the application to enter an undesired state.

This can be avoided by using ICE/Debug Mode. When this mode is enabled. The AIC performs interrupt stacking only when a write access is performed on the AIC\_IPER. Hence, the interrupt service routine must write to the AIC\_IPER (any value) just after reading it. When AIC\_IPER is written, the new status of AIC, including the value of interrupt source number register (AIC\_ISNR), is updated with the value that is kept at previous reading of AIC\_IPER. The debug system must not write to the AIC\_IPER as this would cause undesirable effects.

The following table shows the main steps of an interrupt and the order in which they are performed according to the mode:

ACTION	NORMAL MODE	ICE/DEBUG MODE
Calculate active interrupt	Read AIC_IPER	Read AIC_IPER
Determine and return the vector of the active interrupt	Read AIC_IPER	Read AIC_IPER
Push on internal stack the current priority level	Read AIC_IPER	Write AIC_IPER
Acknowledge the interrupt (Note 1)	Read AIC_IPER	Write AIC_IPER
No effect (Note 2)	Read AIC_IPER	

Notes:

- NIRQ de-assertion and automatic interrupt clearing if the source is programmed as level sensitive.
- Note that software which has been written and debugged using this mode will run correctly in normal mode without modification. However, in normal mode writing to AIC\_IPER has no effect and can be removed to optimize the code

If bit0 of AIC_TEST has been set, ICE or debug monitor can read AIC_IPER for verification and the AIC_IPER will not be cleared automatically. Write access to the AIC_IPER will perform the interrupt stacking in this mode.</p> <p><b>TEST: ICE/Debug mode</b>            0 = normal mode.            1 = ICE/Debug mode.</p>

## 7.15 General-Purpose Input/Output

The General-Purpose Input/Output (**GPIO**) module possesses 71 pins and serves multiple function purposes. Each port can be configured by software to meet various system configurations and design requirements. Software must configure each pin before starting the main program. If a pin is not used for multiplexed functions, the pin can be configured as I/O port

Two extended interrupts nIRQ4 (GPIO0 pin) and nIRQ5 (nWAIT pin) are used the same interrupt request (channel #31) of AIC. It can be programmed as low/high sensitive or positive/negative edge triggered. When interrupt #31 assert in AIC, software can poll **XISTATUS** status register to identify which interrupt occur.

These 71 IO pins are divided into 7 groups according to its peripheral interface definition.

- Port0: 5-pin input/output port
- Port1: 10-pin input/output port
- Port2: 10-pin input/output port
- Port3: 8-pin input/output port
- Port4: 11-pin input/output port
- Port5: 15-pin input/output port
- Port6: 12-pin input/output port

BITS	DESCRIPTION	
[31:2]	RESERVED	-
[1]	<b>INT5</b>	<b>Interrupt 5 status</b> When interrupt input is detected with ISTYPE5 triggered condition, this flag will be set. It must be cleared by software. 1 = interrupt detected. 0 = No interrupt
[0]	<b>INT4</b>	<b>Interrupt 4 status</b> When interrupt input is detected with ISTYPE4 triggered condition, this flag will be set. It must be cleared by software. 1 = interrupt 4 is detected. 0 = no interrupt

## 7.16 Real Time Clock

Real Time Clock (RTC) block can be operated by independent power supply while the system power is off. The RTC block utilizes an external crystal to generate 32.768 KHz clock. The RTC can transmit data to CPU as BCD values. The data include the time by second, minute, hour and the date by day, month, and year. In addition, to reach better frequency accuracy, the RTC counter can be adjusted by software.

RTC features are shown as below:

- Time counter (second, minute, hour) and calendar counter (day, month, year).
- Alarm register (second, minute, hour, day, month, year).
- 12/24 hour mode selectable.
- Recognize leap year automatically.
- Day of the week counter.
- Frequency compensate register (RTC\_FCR).
- Beside RTC\_FCR, all clock and alarm data expressed in BCD code.
- Support tick time interrupt

**RTC Initiation:** When RTC block is power on, programmer has to write a number (0xa5eb1357) to RTC\_INIR to reset all logic. RTC\_INIR act as hardware reset circuit. Once RTC\_INIR has been set as 0xa5eb1357, user cannot reload any other value.

**RTC write enable:** Register RTC\_AER bit 15~0 is RTC read /write password. It is used to avoid signal interference from system during system power off. RTC\_AER bit 15~0 has to be set as 0xa965 before user want to write new data into all registers besides RTC\_INIR. If user set RTC\_AER as 0xa965, RTC\_WRITE\_EN will be raised high. Then user can feel free to write data into register. RTC\_WRITE\_EN will keep high for a short period (about 24ms) and it will be pull low by internal state machine automatically.

**Frequency Compensation:** The RTC\_FCR allows software control digital compensation of a 32.768 KHz crystal oscillator. User can utilize a frequency counter to measure RTC clock in one of GPIO pin during manufacture, and store the value in Flash memory for retrieval when the product is first power on.

**Time and Calendar counter:** RTC\_TLR and RTC\_CLR are used to load the time and calendar. RTC\_TAR and RTC\_CAR are used as alarm. They are all BCD counters.

**12/24 hour Time scale selection:** The 12/24 hour time scale selection depend on RTC\_TSSR bit 0.

**Day of the week counter:** Count from Sunday to Saturday

**Tick Time interrupt:** RTC block use a counter to calibrate the tick time count value. When the value in counter reaches zero, RTC will issue an interrupt.

**RTC register property:** When system power is off but RTC power is on, data stored in RTC registers will not be lost except RTC\_TSSR, RTC\_RIER and RTC\_RIIR. Because of difference between RTC clock and system clock, every time user write new data to any one register, the register will be updated until 2 RTC clock later (60us).

In addition, user must be aware that RTC block does not check whether loaded data is out of bounds. RTC does not check rationality between RTC\_DWR and RTC\_CLR either.

## 7.16.1 RTC Register Map

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE

## 7.17 Smart Card Host Interface

The Smart Card resides in APB bus.

The whole chip of W90P710 operates at voltage level of 3.3 V except Smart Card Interface port's I/O pins that are at 5 V to be compatible with mainstream Smart Card implementations. Advanced power management feature further optimizes power consumption whether in operation or in power down mode.

- ISO-7816 compliant
- PC/SC T=0, T=1 compliant
- 16-byte transmitter FIFO and 16-byte receiver FIFO
- FIFO threshold interrupt to optimize system performance
- Programmable transmission clock frequency
- Versatile baud rate configuration
- UART-like register file structure
- Versatile 8-bit, 16-bit, 24-bit time-out counter for Answer-To-Reset (ATR) and waiting times processing.
- Parity error counter in reception mode and in transmission mode with automatic re-transmission.
- Automatic activation and deactivation sequence through an independence sequencer

### 7.17.1 Register Mapping

**R:** read only, **W:** write only, **R/W:** both read and write, **C:** Only value 0 can be written.

BITS	DESCRIPTIONS	
[31:11]	<b>RESERVED</b>	-
[10]	<b>ETOR2</b>	<p><b>TOR2 interrupt enable bit</b></p> <p>When 24 bit time-out counter decrease to zero, it will set TO2 flag to high. If we set ETOR2 to high, then the 24 bit time-out counters will interrupt CPU to indicate that the time-out count is reached.</p>
[9]	<b>ETOR1</b>	<p><b>TOR1 interrupt enable bit</b></p> <p>When 16 bit time-out counter decrease to zero, it will set TO1 flag to high. If we set ETOR1 to high, then the 16 bit time-out counters will interrupt CPU to indicate that the time-out count is reached.</p>
[8]	<b>ETOR0</b>	<p><b>TOR0 interrupt enable bit</b></p> <p>When 8 bit time-out counter decrease to zero, it will set TO0 flag to high. If we set ETOR0 to high, then the 8 bit time-out counters will interrupt CPU to indicate that the time-out count is reached.</p>
[7]	<b>PWRDN</b>	<p><b>Smart card POWER DOWN bit</b></p> <p><b>PWRDN</b> is used when the Smartcard controller needs to be powered down. Powering down must be done whenever the controller needs to switch between class A and B. When this bit is a '1', it will deactivate all contacts to the Smartcard except for SCRST_L which will be discussed later.</p>
[6]	<b>Interface</b>	<p><b>Smart card different interface bit</b></p> <p><b>Interface</b> is used for controlling the different power control device signals. When '1', the controller will direct a power control pin is active high. When '0', a power control pin is active low to meet different power control interface.</p>
[5:4]	<b>RESERVED</b>	Reserved for future
[3]	<b>ESCPTI</b>	<p><b>Smart card present toggle interrupt enable bit</b></p> <p>A rising/falling edge of SCPSNT signal triggers an interrupt if this bit is set to "1".</p> <p>0 = SCPSNT toggle interrupt is disabled.</p> <p>1 = SCPSNT toggle interrupt is enabled.</p>
[2]	<b>ESCSRI</b>	<p><b>Enable SCSR interrupt bit</b></p> <p>An <b>ESCSRI</b> means interrupt enable bit for SCSR-related events such as silent byte detected error, no stop bit error, parity bit error or overrun error. Any SCSR-related event as described above will trigger an interrupt if this bit is set to "1".</p> <p>0 = SCSR-related event interrupt is disabled.</p> <p>1 = SCSR-related event interrupt is enabled.</p>

Continued

BITS		DESCRIPTIONS
[1]	<b>ETBREI</b>	<p><b>Enable Transmit Buffer Empty interrupt bit</b></p> <p>An <b>ETBREI</b> means interrupt enable bit for TBR (Transmitter Buffer Register) empty condition. An interrupt is issued when TBR is empty and this bit is set to "1".</p> <p>0 = TBR empty interrupt is disabled.</p> <p>1 = TBR empty interrupt is enabled.</p>
[0]	<b>ERDRI</b>	<p><b>Enable Receive Data Ready interrupt bit</b></p> <p>The active FIFO threshold level for this kind of interrupt when FIFO is enabled is specified in RxTL1 and RxTL0 (bit 7 and bit 6 of SCFR at base address + 8. Refer to description of SCFR for details). An interrupt is issued if a data byte is ready for host to read when FIFO is disabled or incoming data from card reaches active FIFO threshold level when FIFO is enabled.</p>

**Interrupt Status Register (SCHI\_ISR)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
<b>SCHI_ISR0</b>	0xFFFF8_5008 (DLAB = 0)	R	Interrupt Status Register 0	0x0000_00C1

<b>FIFO enabled</b>	<b>FIFO enabled</b>	<b>SCPSNT</b>	<b>SCPTI</b>	<b>INTS2</b>	<b>INTS1</b>	<b>INTS0</b>	<b>Interrupt pending</b>

This register contains mainly interrupt status including transmission-related interrupts and SCPSNT toggle interrupt. Transmission-related interrupt status is coded and prioritized as in UART implementation. User may also find FIFO enable/disabled status reflecting what is set in bit 0 of SCFR (write only Smart Card FIFO Register at base address + 8 when BDLAB = 0) and SCPSNT line status.

BITS		DESCRIPTIONS																																																																								
[31:6]	RESERVED	-																																																																								
[5]	SCPSNT	<p><b>Smart card present</b> line status.                      User may poll this bit to see SCPSNT pin's voltage level                      0 = Smart card has been remove from the reader                      1 = Smart card IC is contact with the reader</p>																																																																								
[4]	SCPTI	<p><b>SCPSNT toggle interrupt</b> status.                      A rising/falling edge of SCPSNT signal triggers an interrupt and set this status bit if ESCPTI (IER bit 3) is set to "1" to enable SCPSNT toggle interrupt.                      0= No SCPSNT toggle interrupt.                      1 = SCPSNT toggle interrupt occurs.</p>																																																																								
[3:1]	INTS2 INTS0	<p><b>Interrupt Status bit 2 ~0</b>                      The combination indicates which kind of transmission-related interrupt has occurred. BITS	DESCRIPTIONS	
[5:3]	<b>PEC2, PEC1, PEC0</b>	<p><b>Parity Error Count.</b>            Bits PEC2, PEC1 and PEC0 determine the number of allowed repetitions in reception or in transmission before setting bit PBER in SCSR.            The value 000 indicates that, if only one parity error has occurred, bit PE is set; the value 111 indicate that bit PE will be set after 8 parity errors.</p> <p><b>In protocol T =0:</b>            If a correct character is received before the programmed error number is reached, the error counter will be reset            If the programmed number of allowed parity errors is reached, bit PBER in register SCSR will be set as long as register SCSR has not been read.            If a transmitted character has been NAK by the card, then our smart card host interface will automatically re-transmit it a number of times equal to the value programmed in bits PEC2, PEC1 and PEC0.            In transmission mode, if bits PEC2, PEC1 and PEC0 are logic 0, then the automatic re-transmission is invalidated; the character manually rewritten in register TBR will start at 13.5 ETU.</p> <p><b>In protocol T= 1:</b>            The error counter has no action; bit PE is set at the first incorrectly received character.</p>
[2]	<b>TxFRST</b>	<p><b>Transmitter FIFO Reset</b> control bit.            Setting this bit to a logical "1" resets the transmitter FIFO counter to initial state. This bit is self-cleared to "0" after being set to "1". Default is "0".</p>
[1]	<b>RxFRST</b>	<p><b>Receiver FIFO Reset</b> control bit.            Setting this bit to a logical "1" resets the receiver FIFO counter to initial state. This bit is self-cleared to "0" after being set to "1". Default is "0".</p>

BITS	DESCRIPTIONS	
[31:8]	<b>RESERVED</b>	-
[7]	<b>BDLAB</b>	<p><b>Baud rate Divisor Latch Access Bit.</b> When this bit is set to a logical "1", users may access baud rate divisor (in 16-bit binary format) through divisor latches (BLH and BLL) of baudrate generator during a read/write operation. A special Smart Card ID can also be read at base address + 8 when BDLAB is "1". When this bit is set to "0", accesses to base address + 0, 4 or 8 refer to RBR/TBR, IER or ISR/SCFR respectively.</p>
[6]	<b>DIR</b>	<p><b>DIRect convention</b> When set as a '0' or '1' will receive data in the direct convention or indirect convention manner respectively. In other words, the controller will need to have this bit set to a '1' if the first byte of the ATR process is 3F (i.e. Indirect convention) and a '0' if the first byte is 3B (i.e. Direct convention).</p>
[5]	<b>NSBE</b>	<p><b>Silent Byte Enable.</b> Receiver detect the data byte, parity bit and stop bit are all zero</p>
[4]	<b>EPE</b>	<p><b>Even Parity Enable.</b> This bit is only available when bit 3 of SCCR is programmed to "1". It prescribes number of logical 1s in a data word including parity bit. When this bit is set to "1", even parity is required for transmission and reception. Odd parity is demanded when this bit is set to "0".  In contrast to its UART counterpart, Smart Card Control Register only controls parity bit setting because data length is fixed at 8-bit long for Smart Card interface protocol.</p>
[3]	<b>Protocol</b>	<p><b>Protocol.</b> Bit PROT is set if the protocol is T = 1 (asynchronous) and bit PROT = 0 if the protocol is T = 0.</p>

8-bit clock base Data							

BITS	DESCRIPTIONS	
[31:8]	RESERVED	-
[7:0]	CBR	<p><b>Clock Base</b> value. It specifies number of internal sampling clock pulses for a data bit. Default to be 0Ch.</p> <p>This register combining with BLH and BLL (baud rate latches) determine internal sampling clock frequency. For example, CBR defaults to be 0Ch and BLH, BLL default to be 1Fh which mean SCCLK clock frequency is 372 (12 x 31) times of internal sampling clock frequency. The default values of CBR, BLH and BLL are corresponding to default values of transmission factors F and D specified in ISO/IEC 7816-3. The value of 0Ch of CBR means there're 12 sampling clock pulses to detect a 1-etu (elementary time unit) data bit on SCIO signal. It is recommended that user sets CBR to be around 16 to maintain better data integrity and transmission stability.</p>

### Smart Card Host Status Register (SCHI\_SCSR)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
SCHI_SCSR0	0xFFF8_5014	R	Smart card Status Register 0	0x0000_0060

RESERVED						SCRST_L	Reserved

BITS	DESCRIPTIONS	
[31:2]	RESERVED	-
[1]	SCRST_L	<p><b>Smart card Reset pin control bit</b></p> <p>Software driver controls this bit directly which in turn determines the SCRST_L signal to the Smart Card. '0' or '1' in this bit drives '0' or '1' respectively on the SCRST_L signal. This feature was first added to allow the SCRST_L to be pulled high at a quicker rate during the reset phase to improve testability. However, upon the attempt to further improve the capability of the Smart Card host, it was found that this bit holds the key in solving one of the major problems of this design.</p> <p>Originally, the SCRST_L signal is pulled high automatically after a fixed period of time (via the use of a hardware counter) when the card is inserted. However, there have been many cases where this signal is pulled high even <b>before</b> power is supplied to the card, which is a clear violation to the ISO 7816 specification. This as a result causes non valid ATR to be read by the host during the initial insertion of the card. Earlier versions of this IP rectified this problem by having the software ignore the invalid ATR during the initial insertion and do either a warm or cold setup to capture the true ATR on its second try.</p> <p>This bit allows a lot of flexibility to fix the problem mentioned above. Software driver now has the ability to determine when the SCRST_L is to be pulled either high or low, avoiding this problem which has plagued earlier versions. With this modification, software ensures that the SCRST_L signal is pulled high only <b>after</b> the power is supplied to the card, thus allowing the true ATR to be always read during the initial insertion of the card.</p>

### 7.17.3 Functional description

The following description uses abbreviations to refer to control/status registers and their contents of Smart Card interface as seen in section 7.12.2

#### ● Initialization

User needs to program control registers so that ATR (Answer To Reset) data streams can be properly decoded after card insertion. Initialization settings include the following steps where sequential order is irrelevant.

1. BLH, BLL and CBR are written with 00h, 1Fh and 0Ch respectively to comply with default transmission factors Fd and Dd which are 372 and 1 as specified in ISO/IEC 7816-3.
2. GTR is programmed with 01h for one stop bit.
3. Set SCFR bit 1 to "1" to reset receiver FIFO.
4. Set EPE bit in SCCR bit 4 to be "1" for EVEN parity, set EPE bit to be "0" for odd parity.
5. Set SCKFS1 and SCKFS0 to "05" to select 2.5 MHz for SCCLK on 80MHz system clock.

Most default values of above control bits are designed as specified in initialization step but it is recommended that user performs all the initialization sequence to avoid any ambiguity.

The relationship between transmission factors and settings of BLH, BLL and CBR is best described in the following example.

$$1\text{etu} = \frac{F}{D} \times \frac{1}{f} \quad (\text{f means SCCLK frequency})$$

Therefore,

$$\frac{F_d}{D_d} = \frac{372}{1} = (\text{BLH, BLL}) \times \text{CBR} = 31 \times 12$$

#### ● Activation

Card insertion pulls up SCPSNT (assuming SCPSNT in ISR bit 5 is active high) and in consequence SCPWR# is pulled down to activate power MOS to supply power to card slot after a delay of about 5 ms. This delay is for card slot mechanism to settle down before power is actually applied.

SCCLK starts to output clocks right after SCPWR# is active while SCIO is in reception mode and pulled up externally. SCRST# keeps low initially to reset card but will output high after 512 clock cycles to meet requirement of tb of more than 400 clock cycles (specified in ISO/IEC 7816-3).

To meet another timing requirement, tc of ISO/IEC 7816-3, a counter based on SCCLK is implemented to start counting on the rising edge of SCRST#. SCPWR# is deactivated if no ATR (Answer To Reset) is detected after 65536 clock cycles from the rising edge of SCRST#.

#### ● Answer-to-Reset

Answer-to-Reset (ATR) is the data streams sent by the card to the interface as an answer to a reset on SCRST# signal. Refer to ISO/IEC 7816-3 for detailed description of ATR.

There're two kinds of cards specified in ISO/IEC 7816-3, inverse convention card and direct convention card. Although these two conventions treat logical meanings (0 or 1) of voltage levels (low or high) differently, Winbond's implementation of Smart Card interface decodes a high voltage level data bit as "1" and low voltage level data bit "0" nevertheless and resorts to software to interpret

incoming data. Software driver needs to interpret initial character of ATR first to determine which convention is for inserted card and chooses a conversion procedure for it. Subsequent incoming data bytes must be passed through a conversion procedure before actually transfers these data bytes to host. Similar conversion procedure must be applied to outgoing data byte before writing to TBR too.

For example, the raw data byte for initial character of inverse-convention ATR would be 3Fh. Software driver therefore needs a conversion procedure to reverse bit-significance and polarity to process subsequent raw data bytes. On the other hand, initial character of direct-convention ATR is 3Bh which needs no conversion procedure to process data byte.

## ● Data transfer

Software driver might need to configure control registers again based on information contained in ATR before process subsequent data transfer. The following guidelines are provided for programming reference.

1. EPE should be set to "1" for direct-convention card and otherwise for inverse-convention card.
2. BLH, BLL and CBR should be set to comply with Fi and Di.
3. GTR is used for various stop bit requirement of different transmission protocols.
4. Use interrupt resources to control communication sequence.
5. Monitor SCSR for transmission integrity.

## ● Cold reset and warm reset

Cold reset is achieved by writing a "1" to PWRDN (bit 7 of IER). It deactivates SCPWR# to high. Consequentially, SCRST# is pulled down and SCCLK is stopped. User must write a "0" to PWRDN (bit 7 of IER) to resume Smart Card interface to a normal activation state assuming card is still present. The activation sequence and deactivation sequence are done by internal F.S.M

When in a normal activation state, writing a "0" SCRST\_L (bit 1 of TMR) will force SC\_RST pin to low that will triggers a warm reset. Its effect is similar to cold reset except SCPWR# is kept activated and therefore power supply to card stays on.

## ● Power states

SCHI employs a sophisticated algorithm to partition Smart Card interface's internal circuits to achieve optimal power utilization. However, users must pay extra care in the design of application circuits following guidelines stated below to prevent potential signal conflict and unnecessary power consumption.

There're three power states: disabled state, active state, and power down state. Disabled state is the default state when power is first applied to the IC. SCPWD (Smart Card Power Down) controls whether in active state (SCPWD = 0) or in power down state (SCPWD = 1).

## ● Disabled state

Smart Card interface is in disabled state initially. Clock is stopped in this state and therefore it is the least power-consuming state. To prevent current leakage from floating connections, it is designed to output a predetermined voltage level on all the I/O pins of Smart Card interface as follows:

SCPWR# outputs high to disable power supply to socket;

SCRST#, SCCLK, and SCIO output low;

SCPSNT is tri-stated.

These I/O conditions also apply to socket in power down state (SCPWD = 1) or deselected socket in idle state. Designers of application circuits must take extra care so that no contention occurs when Smart Card interface is in those power-saving states.

- **Active state**

Active state is when Smart Card interface is actually performing all its functions: configuration of control and interrupt registers, detection of card insertion/extraction, reception of ATR (Answer To Reset) packet and communication of information between host and card. Refer to section 7.12.3 for detailed function description.

This is the most power-consuming state and actual power consumption is dependent on traffic of interface.

- **Power down state**

Transition from active state to power down state is accomplished by setting SCPWD to "1". Clock is stopped for most internal core circuits except detection circuit for SCPSNT toggle (card insertion/extraction). SCPSNT toggle can interrupt CPU and through this feature Smart Card interface in power down state can be waken up by card insertion/extraction. User may also directly write a "0" to SCPWD to wake up Smart Card interface.

Smart Card interface spends a little bit more power to maintain SCPSNT toggle detection circuit in power down state than in disabled state while spares even more power than in active state by stopping clock to core circuit.

Users must make sure that all on-going transactions are concluded before putting Smart Card interface into power down state to prevent potential disoperation of internal state machine.

## 7.18 I<sup>2</sup>C Interface

I<sup>2</sup>C is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The I<sup>2</sup>C standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

Serial, 8-bit oriented bi-directional data transfers can be made up to 100 kbit/s in Standard-mode, up to 400 kbit/s in the Fast-mode, or up to 3.4 Mbit/s in the High-speed mode. Only 100kbps and 400kbps modes are supported directly. For High-speed mode special IOs are needed. If these IOs are available and used, then High-speed mode is also supported.

Data is transferred between a Master and a Slave synchronously to SCL on the SDA line on a **byte-by-byte** basis. Each data byte is 8 bits long. There is one SCL clock pulse for each data bit with the **MSB being transmitted first**. An acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP).

The I<sup>2</sup>C Master Core includes the following features:

- AMBA APB interface compatible
- Compatible with Philips I<sup>2</sup>C standard, support master mode
- Multi Master Operation
- Clock stretching and wait state generation
- Provide multi-byte transmit operation, up to 4 bytes can be transmitted in a single transfer
- Software programmable acknowledge bit
- Arbitration lost interrupt, with automatic transfer cancellation
- Start/Stop/Repeated Start/Acknowledge generation
- Start/Stop/Repeated Start detection
- Bus busy detection
- Supports 7 bit addressing mode
- Fully static synchronous design with one clock domain
- Software mode I<sup>2</sup>C

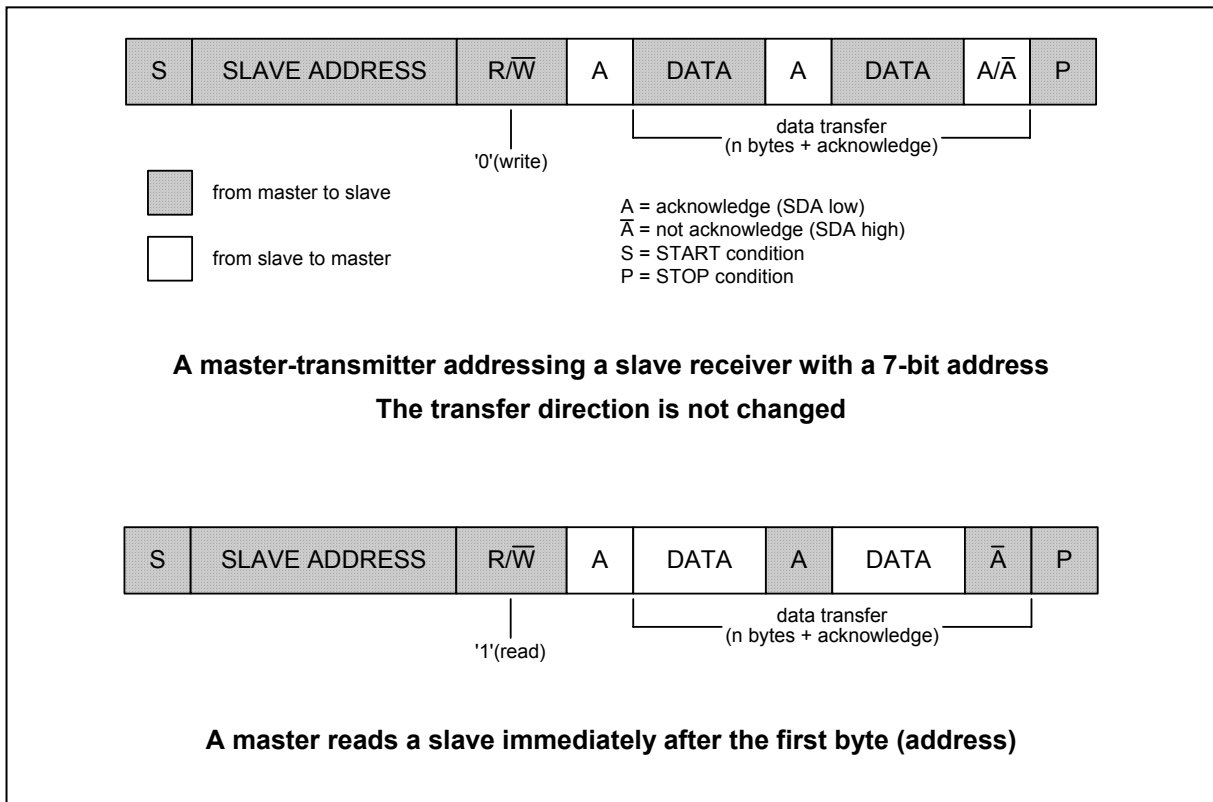

**7.18.1 I<sup>2</sup>C Protocol**

Normally, a standard communication consists of four parts:

- 1) START or Repeated START signal generation
- 2) Slave address transfer
- 3) Data transfer
- 4) STOP signal generation

**Fig. 7.18.1.1 Data transfer on the I<sup>2</sup>C-bus**

### START or Repeated START signal

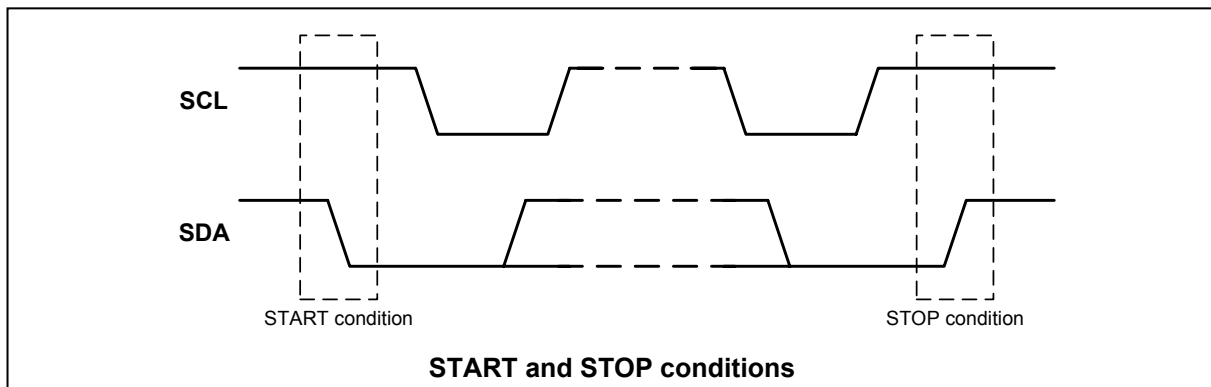

When the bus is free/idle, meaning no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the **S-bit**, is defined as a **HIGH to LOW** transition on the SDA line while SCL is **HIGH**. The START signal denotes the beginning of a new data transfer.

A Repeated START (Sr) is a START signal without first generating a STOP signal. The master uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus.

The I<sup>2</sup>C core generates a START signal when the START bit in the Command Register (CMDR) is set and the READ or WRITE bits are also set. Depending on the current status of the SCL line, a START or Repeated START is generated.

### STOP signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the **P-bit**, is defined as a **LOW to HIGH** transition on the SDA line while SCL is **HIGH**.

### Slave Address Transfer

The first byte of data transferred by the master immediately after the START signal is the slave address. This is a 7-bits calling address followed by a RW bit. The RW bit signals the slave the data transfer direction. No two slaves in the system can have the same address. Only the slave with an address that matches the one transmitted by the master will respond by returning an acknowledge bit by pulling the SDA low at the 9th SCL clock cycle.

The core treats a Slave Address Transfer as any other write action. Store the slave device's address in the Transmit Register (TxR) and set the WRITE bit. The core will then transfer the slave address on the bus.

**The first byte after the START procedure**

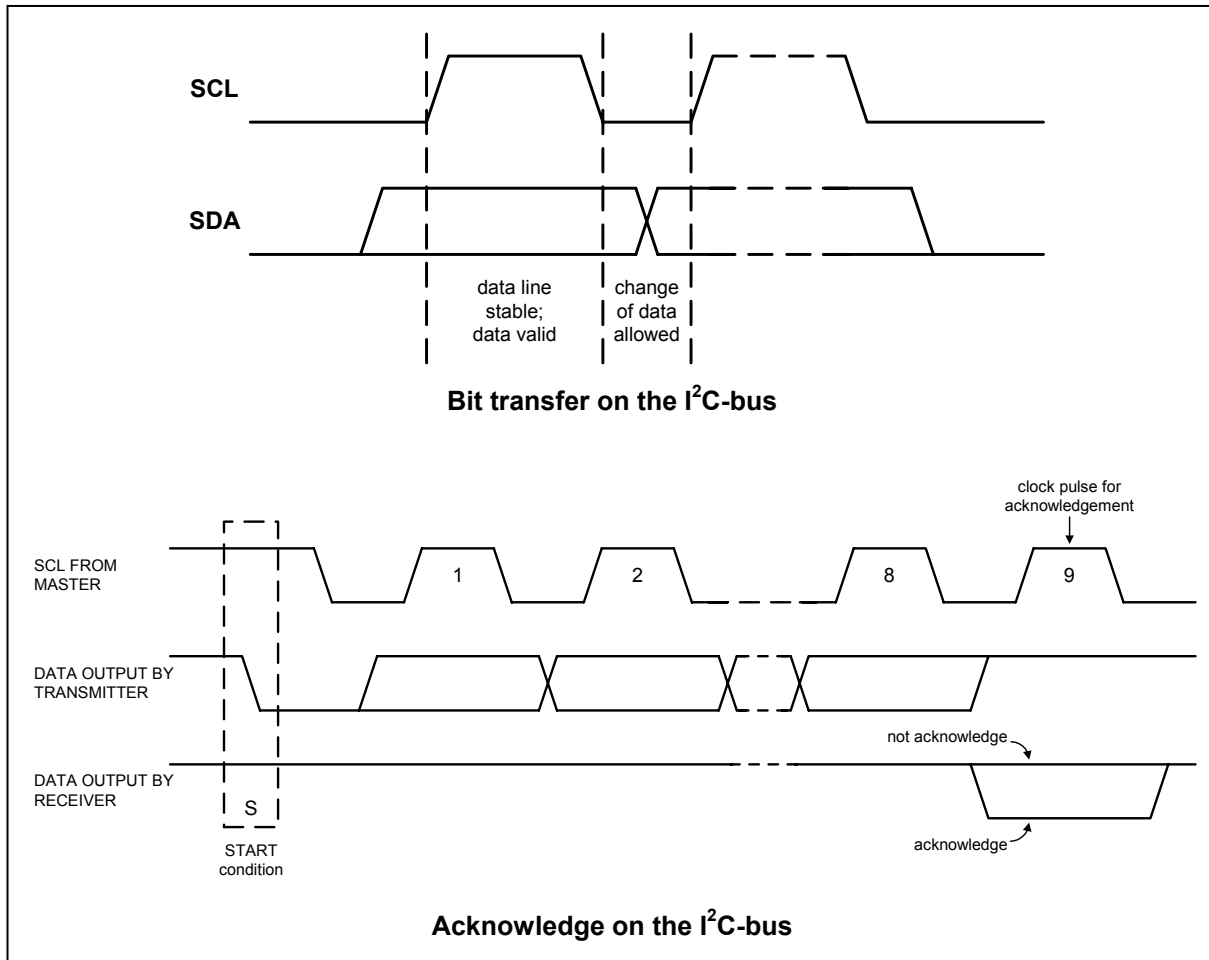

**Data Transfer**

Once successful slave addressing has been achieved, the data transfer can proceed on a byte-by-byte basis in the direction specified by the RW bit sent by the master. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a **Not Acknowledge (NACK)**, the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

If the master, as the receiving device, does **Not Acknowledge (NACK)** the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal.

To write data to a slave, store the data to be transmitted in the Transmit Register (TxR) and set the WRITE bit. To read data from a slave, set the READ bit. During a transfer the core set the I2C\_TIP flag, indicating that a **Transfer is In Progress**. When the transfer is done the I2C\_TIP flag is cleared, the IF flag set if enabled, then an interrupt generated. The Receive Register (RxR) contains valid data after the IF flag has been set. The software may issue a new write or read command when the I2C\_TIP flag is cleared.

**7.18.2 I2C Serial Interface Control Registers Map**

R: read only, W: write only, R/W: both read and write

NOTE1: The reset value of I2C\_WR0/1 is 0x3F only when SCR, SDR and SER are connected to pull high resistor.

7	6	5	4	3	2	1	0
Tx[7:0]							

BITS	DESCRIPTIONS	
[31:0]	<b>Tx</b>	<p><b>Data Transmit Register</b></p> <p>The I<sup>2</sup>C core used 32-bit transmit buffer and provide multi-byte transmit function. Set CSR[Tx_NUM] to a value that you want to transmit. I<sup>2</sup>C core will always issue a transfer from the highest byte first. For example, if CSR[Tx_NUM] = 0x3, Tx[31:24] will be transmitted first, then Tx[23:16], and so on.</p> <p>In case of a data transfer, all bits will be treated as data.</p> <p>In case of a slave address transfer, the first 7 bits will be treated as 7-bit address and the LSB represent the R/W bit. In this case,</p> <p>LSB = 1, reading from slave</p> <p>LSB = 0, writing to slave</p>

### 7.19 Universal Serial Interface

The USI is a synchronous serial interface performs a serial-to-parallel conversion on data characters received from the peripheral, and a parallel-to-serial conversion on data characters received from CPU. This interface can drive up to 2 external peripherals and is seen as the master. It can generate an interrupt signal when data transfer is finished and can be cleared by writing 1 to the interrupt flag. The active level of device/slave select signal can be chosen to low active or high active, which depends on the peripheral it's connected. Writing a divisor into DIVIDER register can program the frequency of serial clock output. This master core contains four 32-bit transmit/receive buffers, and can provide burst mode operation. The maximum bits can be transmitted/received is 32 bits, and can transmit/receive data up to four times successive.

The USI (Microwire/SPI) Master Core includes the following features:

- AMBA APB interface compatible
- Support USI (Microwire/SPI) master mode
- Full duplex synchronous serial data transfer
- Variable length of transfer word up to 32 bits
- Provide burst mode operation, transmit/receive can be executed up to four times in one transfer
- MSB or LSB first data transfer
- Rx and Tx on both rising or falling edge of serial clock independently
- 2 slave/device select lines
- Fully static synchronous design with one clock domain

15	14	13	12	11	10	9	8
Rx[15:8]							
7	6	5	4	3	2	1	0
Rx[7:0]							

BITS	DESCRIPTIONS	
[31:0]	Rx	<p><b>Data Receive Register</b></p> <p>The Data Receive Registers hold the value of received data of the last executed transfer. Valid bits depend on the transmit bit length field in the CNTRL register. For example, if CNTRL[Tx_BIT_LEN] is set to 0x08 and CNTRL[Tx_NUM] is set to 0x0, bit Rx0[7:0] holds the received data.</p> <p><b>NOTE:</b> The Data Receive Registers are <b>read only</b> registers. A Write to these registers will actually modify the Data Transmit Registers because those registers share the same FFs.</p>

### Data Transmit Register 0/1/2/3 (Tx0/1/2/3)

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
USI_TX0	0xFFF8_6210	W	USI Data Transmit Register 0	0x0000_0000
USI_TX1	0xFFF8_6214	W	USI Data Transmit Register 1	0x0000_0000
USI_TX2	0xFFF8_6218	W	USI Data Transmit Register 2	0x0000_0000
USI_TX3	0xFFF8_621C	W	USI Data Transmit Register 3	0x0000_0000

31	30	29	28	27	26	25	24
Tx[31:24]							
23	22	21	20	19	18	17	16
Tx[23:16]							
15	14	13	12	11	10	9	8
Tx[15:8]							
7	6	5	4	3	2	1	0
Tx[7:0]							

BITS	DESCRIPTIONS	
[31:0]	<b>Tx</b>	<p><b>Data Transmit Register</b></p> <p>The Data Transmit Registers hold the data to be transmitted in the next transfer. Valid bits depend on the transmit bit length field in the CNTRL register. For example, if CNTRL[Tx_BIT_LEN] is set to 0x08 and the CNTRL[Tx_NUM] is set to 0x0, the bit Tx0[7:0] will be transmitted in next transfer. If CNTRL[Tx_BIT_LEN] is set to 0x00 and CNTRL[Tx_NUM] is set to 0x3, the core will perform four 32-bit transmit/receive successive using the same setting (the order is Tx0[31:0], Tx1[31:0], Tx2[31:0], Tx3[31:0]).</p> <p><b>NOTE:</b> The RxX and TxX registers share the same flip-flops, which means that what is received from the input data line in one transfer will be transmitted on the output data line in the next transfer if no write access to the TxX register is executed between the transfers.</p>

## 7.20 PWM

The W90P710 have 4 channels PWM timers. They can be divided into two groups. Each group has 1 Prescaler, 1 clock divider, 2 clock selectors, 2 16-bit counters, 2 16-bit comparators, 1 Dead-Zone generator. They are all driven by PCLK (80 MHz). Each channel can be used as a timer and issue interrupt independently.

Two channels PWM timers in one group share the same prescaler. Clock divider provides each channel with 5 clock sources (1, 1/2, 1/4, 1/8, 1/16). Each channel receives its own clock signal from clock divider which receives clock from 8-bit prescaler. The 16-bit counter in each channel receive clock signal from clock selector and can be used to handle one PWM period. The 16-bit comparator compares number in counter with threshold number in register loaded previously to generate PWM duty cycle.

The clock signal from clock divider is called PWM clock. Dead-Zone generator utilize PWM clock as clock source. Once Dead-Zone generator is enabled, output of two PWM timer in one group is blocked. Two output pin are all used as Dead-Zone generator output signal to control off-chip power device.

To prevent PWM driving output pin with unsteady waveform, 16-bit counter and 16-bit comparator are implemented with double buffering feature. User can feel free to write data to counter buffer register and comparator buffer register without generating glitch.

When 16-bit down counter reaches zero, the interrupt request is generated to inform CPU that time is up. When counter reaches zero, if counter is set as toggle mode, it is reloaded automatically and start to generate next cycle. User can set counter as one-shot mode instead of toggle mode. If counter is set as one-shot mode, counter will stop and generate one interrupt request when it reaches zero.

The value of comparator is used for pulse width modulation. The counter control logic changes the output level when down-counter value matches the value of compare register.

The PWM timer features are shown as below:

- Two 8-bit prescalers and two clock dividers
- Four clock selectors
- Four 16-bit counters and four 16-bit comparators
- Two Dead-Zone generator

### 7.20.1 PWM double buffering and reload automatically

W90P710 PWM Timers have a double buffering function, enabling the reload value changed for next timer operation without stopping current timer operation. Although new timer value is set, current timer operation still operate successfully.

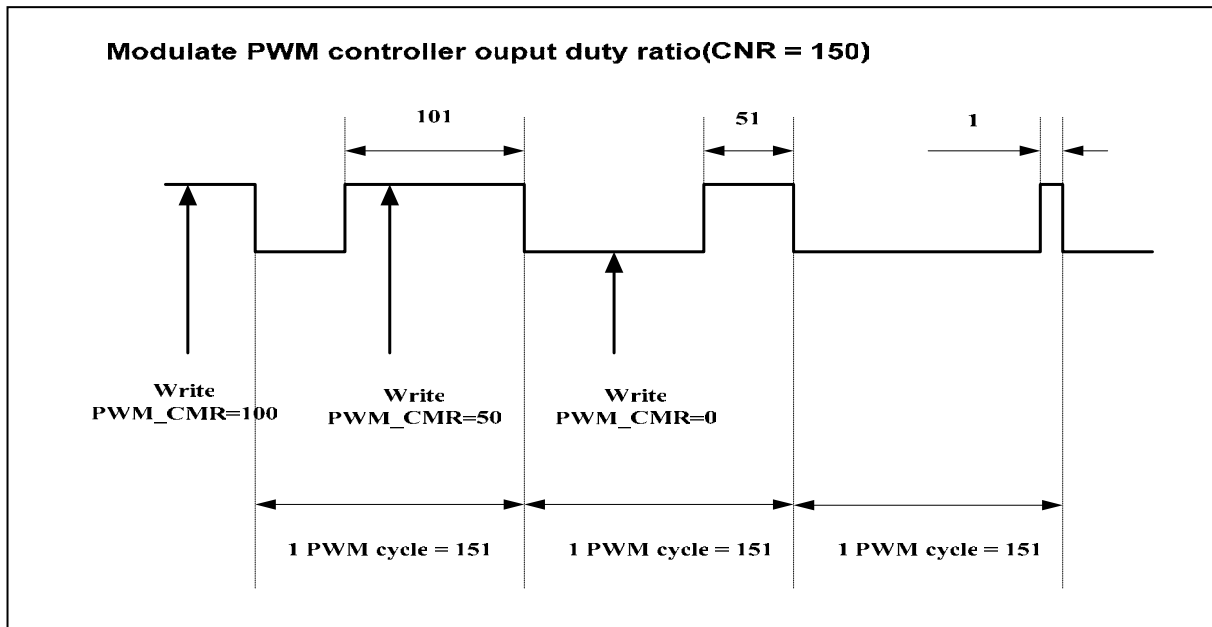

The counter value can be written into PWM\_CNR0, PWM\_CNR1, PWM\_CNR2, PWM\_CNR3 and current counter value can be read from PWM\_PDR0, PWM\_PDR1, PWM\_PDR2, PWM\_PDR3.

The auto-reload operation copies from PWM\_CNR0, PWM\_CNR1, PWM\_CNR2, PWM\_CNR3 to down-counter when down-counter reaches zero. If PWM\_CNR0~3 are set as zero, counter will be halt when counter count to zero. If auto-reload bit is set as zero, counter will be stopped immediately.

### 7.20.2 Modulate Duty Ratio

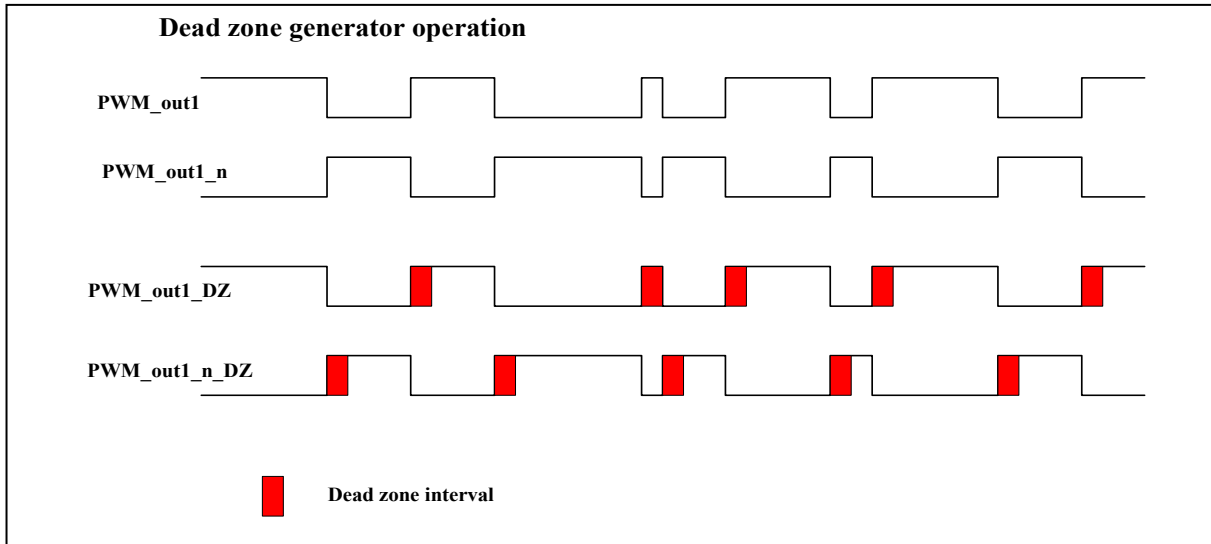

The double buffering function allows CMR written at any point in current cycle. The loaded value will take effect from next cycle.

### 7.20.3 Dead Zone Generator

W90P710 PWM is implemented with Dead Zone generator. They are built for power device protection. This function enables generation of a programmable time gap at the rising of PWM output waveform. User can program PWM\_PPR [31:24] and PWM\_PPR [23:16] to determine the Dead Zone interval.

#### 7.20.4 PWM Timer Start procedure

1. Setup clock selector (PWM\_CSR)
2. Setup prescaler & dead zone interval (PWM\_PPR)
3. Setup inverter on/off, dead zone generator on/off, toggle mode /one-shot mode, and PWM timer off. (PWM\_PCR)
4. Setup comparator register (PWM\_CMR)
5. Setup counter register (PWM\_CNR)
6. Setup interrupt enable register (PWM\_PIER)
7. Enable PWM timer (PWM\_PCR)

#### 7.20.5 PWM Timer Stop procedure

**Method 1** : Set 16-bit down counter(PWM\_CNR) as 0, and monitor PWM\_PDR. When PWM\_PDR reaches to 0, disable PWM timer (PWM\_PCR). (Recommended)

**Method 2** : Set 16-bit down counter(PWM\_CNR) as 0. When interrupt request happen, disable PWM timer (PWM\_PCR). (Recommended)

**Method 3** : Disable PWM timer directly (PWM\_PCR). (Not recommended)

<b>Note: User can clear each interrupt flag by writing a zero to corresponding bit in PIIR</b>		

## 7.21 Keypad Interface

W90P710 Keypad Interface (**KPI**) is an APB slave with 4-row scan output and 8-column scan input. KPI scans an array up to 16x8 with an external 4 to 16 decoder. It can also be programmed to scan 8x8 or 4x8 key array. If the 4x8 array is selected then external decoder is not necessary because the scan signals are divided by W90P710 itself. For minimum pin counts application, an auxiliary priority encoder (TTL 74148) can be used to encode 8 columns input to 3 binary code and one indicator flag. Total 8 pins are required to implement 16x8 key scan.

Any 1 or 2 keys in the array that pressed are debounced and encoded. The keypad controller scan key matrix from ROW0 COL 0 → 1 → 2 .... → 7, ROW1 COL 0 → 1 → 2 ... → 7 till to ROW 16 (or ROW 8 or ROW 4) COL 0 → 0 → 1 .... → 7. If more than 2 keys are pressed, only the keys or apparent keys in the array with the lowest address will be decoded.

KPI also supports 2-keys scan interrupt and specified 3-keys interrupt or chip reset. If the 3 pressed keys matches with the 3 keys defined in **KPI3KCONF**, it will generate an interrupt or chip reset to nWDOG reset output depend on the **ENRST** setting. The interrupt is generated whenever the scanner detects a key is pressed. The interrupt conditions are 1 key, 2 keys and 3keys.

W90P710 provides two keypad connecting interface. One is allocated in LCD (GPIO30-41) interface, the other is in Ethernet RMII PHY interface and I2C interface 2 SDA1, SCL1 (GPIO42-51). Software should set KPSEL bit in KPICONF register to decide which interface is used as keypad connection port.

The keypad interface has the following features:

- maximum 16x8 array
- programmable debounce time
- low-power wakeup mode
- programmable three-key reset

[18]	3KEY	<p><b>Specified three-key is detected.</b></p> <p>This flag indicates specified-three-keys was detected. Software can read this bit to know the keypad interrupt is 3 key or not.</p>
[17]	2KEY	<p><b>Double-key press</b></p> <p>This bit indicates that 2 keys have been detected. Software can read {KEY1R, KEY1C} and {KEY0R, KEY0C} to know which two keys are pressed.</p>

Continued

BITS	DESCRIPTION	
[16]	1KEY	<b>Single-key press</b> This bit indicates that 1 key has been detected. Software can read {KEY0R, KEY0C} to know which key is pressed.
[15]	RESERVED	-
[14:11]	KEY1R	<b>KEY1 row address</b> This value indicates key1 row address. The keypad controller scan keypad matrix from row 0, column0 →1 →2 .... → 7 and then row1 column 0 → 1 → 2 →7 so the lowest key address will be stored in {KEY0R, KEY0C}. This register stores the 2 <sup>nd</sup> address, if more than one key is pressed.
[10:8]	KEY1C	<b>KEY1 column address</b> This value indicates key1 column address..
[7]	RESERVED	-
[6:3]	KEY0R	<b>KEY1 row address</b> This value indicates key0 row address. This value indicates key1 row address. The keypad controller scan keypad matrix from row 0, column0 →1 →2 .... → 7 and then row1 col 0 → 1 → 2 → ... → 7 still to row16 (or 8, or 4) column 0 → 1 → 2 ..... → 7 so the lowest key address will be stored in {KEY0R, KEY0C}.
[2:0]	KEY0C	<b>KEY1 column address</b> This value indicates key0 row address.

### 7.22 PS2 Host Interface Controller

W90P710 PS2 host controller interface is an APB slave consisted of PS2 protocol. It is used to connect to your IBM keyboard or other device through PS2 interface. For example, the IBM keyboard will sends scan codes to the host controller, and the scan codes will tell your Keyboard Bios what keys you have pressed or released. Besides Scan codes, commands can also be sent to the keyboard from host. The most common commands would be the setting/resetting of the status indicators (i.e. the Num lock, Caps Lock & Scroll Lock LEDs).

The PS2 interface implements a bi-directional protocol. The keyboard can send data to the Host and the Host can send data to the Keyboard using two PS2 Clock and PS2 Data lines. Both the PS2 Clock and Data lines are Open Collector bi-directional I/O lines. The Host has the ultimate priority over direction. The keyboard is free to send data to the host when both the PS2 Data and PS2 Clock lines are high (Idle). If the host takes the PS2 Clock line low, the keyboard will buffer any data until the PS2 Clock is released, ie goes high. The transmission of data in the forward direction, ie Keyboard to Host is done with a frame of 11 bits. The first bit is a Start Bit (Logic 0) followed by 8 data bits (LSB First), one Parity Bit (Odd Parity) and a Stop Bit (Logic 1). Each bit should be read on the falling edge of the clock. The Keyboard will generate the clock. The frequency of the clock signal typically ranges from 20 to 30 KHz.

The Host to Keyboard Protocol is initiated by taking the PS2 data line low. It is common to take the PS2 Clock line low for more than 60us and then the KBD data line is taken low, while the KBD clock line is released. After that, the keyboard will start generating a clock signal on its PS2 clock line. After the first falling edge has been detected, host will load the first data bit on the PS2 Data line. This bit will be read into the keyboard on the next falling edge, after which host place the next bit of data. This process is repeated for the 8 data bits. It will follow an Odd Parity Bit after the data byte.

### 7.22.1 PS2 Host Controller Interface Register Map

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
PS2CMD	0xFFF8_9000	R/W	PS2 Host Controller Command Register	0x0000_0000

BITS	DESCRIPTIONS	
[31:6]	RESERVED	-
[5]	<b>TX_err</b>	<p>This Transmit Error Status bit indicates software that device doesn't response ACK after Host wrote a command to it.</p> <p>This bit is valid when TX_IRQ is asserted. It will automatically reset after software starts next command writing process. This bit is read only.</p>
[4]	<b>TX_IRQ</b>	<p>This Transmit Complete Interrupt bit indicates software that the process of Host controller writing command to device is finished. Software needs to write one to this bit to clear this interrupt.</p>

Continued

BITS	DESCRIPTIONS	
[3:1]		Reserved
[0]	RX_IRQ	This Receive Interrupt bit indicates software that Host controller receives one byte data from device. This data is stored at PS2_SCANCODE register. Software needs to write one to this bit to clear this interrupt after reading receiving data in RX_SCAN_CODE register. Note that the reception of the Extend (0xE0) and Release (0xF0) scan code will not cause an interrupt by host. The case of the shift key codes will be determined by the TRAP_SHIFT bit of PS2_CMD register.

**PS2 Host Controller RX Scan Code Register (PS2\_SCANCODE)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
PS2SCANCODE	0xFFFF_9008	R/W	key pad c RX Scan Code Register	0x0000_0000

7	6	5	4	3	2	1	0
RX_SCAN_CODE							

BITS	DESCRIPTIONS	
[31:11]	RESERVED	-
[10]	RX_shift_key	This Receive Shift Key bit indicates that left or right shift key on the keyboard is hold. This bit is read only and will clear by host when the release shift key codes are received.
[9]	RX_release	Receive Released Byte When one key has been released, the keyboard will send F0 (hex) to inform Host controller. This bit indicates software that Host controller receives release byte (F0). This bit is read only and will update when host has received next data byte.

Continued

BITS	DESCRIPTIONS	
[8]	RX_extend	Receive Extend Byte A handful of the keys on keyboard are extended keys and thus require two more scan code. These keys are preceded by an E0 (hex). This bit indicates software that Host controller receives extended byte (E0). This bit is read only and will update when host has received next data byte.
[7:0]	RX_SCAN_CODE	PS2 Host Controller Received Data Field This field stores the original data content transmitted from device. This field is valid when RX_IRQ is asserted. Note that host will not report "Extend" or "Release" scan code to this field and not generate interrupt if they are received by host, i.e. 0xE0 and 0xF0. The case of the shift key codes will be determined by the TRAP_SHIFT bit of PS2_CMD register.

**PS2 Host Controller RX ASCII Code Register (PS2\_ASCII)**

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
PS2ASCII	0xFFF8_900C	R/W	key pad c RX ASCII Code Register	0x0000_0000

RX_ASCII_CODE							

BITS	DESCRIPTIONS	
[31:8]	RESERVED	-
[7:0]	RX_ASCII_CODE	PS2 Host Controller Received Data Filed This field stores the ASCII data content transmitted from device. Therefore, this part translates the scan code into an ASCII value. It will be read as 0x2E when there is no ASCII code mapped to the scan code stored in RX_SCAN_CODE register. This field is valid when RX_IRQ is asserted.

### USI Register Map

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
USI_CNTRL	0xFFF8_6200	R/W	Control and Status Register	0x0000_0004
USI_DIVIDER	0xFFF8_6204	R/W	Clock Divider Register	0x0000_0000
USI_SSR	0xFFF8_6208	R/W	Slave Select Register	0x0000_0000
Reserved	0xFFF8_620C	N/A	Reserved	N/A
USI_Rx0	0xFFF8_6210	R	Data Receive Register 0	0x0000_0000
USI_Rx1	0xFFF8_6214	R	Data Receive Register 1	0x0000_0000
USI_Rx2	0xFFF8_6218	R	Data Receive Register 2	0x0000_0000
USI_Rx3	0xFFF8_621C	R	Data Receive Register 3	0x0000_0000
USI_Tx0	0xFFF8_6210	W	Data Transmit Register 0	0x0000_0000
USI_Tx1	0xFFF8_6214	W	Data Transmit Register 1	0x0000_0000
USI_Tx2	0xFFF8_6218	W	Data Transmit Register 2	0x0000_0000
USI_Tx3	0xFFF8_621C	W	Data Transmit Register 3	0x0000_0000

### PWM Control Registers Map

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
PWM_PPR	0xFFF8_7000	R/W	PWM Prescaler Register	0x0000_0000
PWM_CSR	0xFFF8_7004	R/W	PWM Clock Select Register	0x0000_0000
PWM_PCR	0xFFF8_7008	R/W	PWM Control Register	0x0000_0000
PWM_CNR0	0xFFF8_700C	R/W	PWM Counter Register 0	0x0000_0000
PWM_CMR0	0xFFF8_7010	R/W	PWM Comparator Register 0	0x0000_0000
PWM_PDR0	0xFFF8_7014	R	PWM Data Register 0	0x0000_0000
PWM_CNR1	0xFFF8_7018	R/W	PWM Counter Register 1	0x0000_0000
PWM_CMR1	0xFFF8_701C	R/W	PWM Comparator Register 1	0x0000_0000
PWM_PDR1	0xFFF8_7020	R	PWM Data Register 1	0x0000_0000
PWM_CNR2	0xFFF8_7024	R/W	PWM Counter Register 2	0x0000_0000
PWM_CMR2	0xFFF8_7028	R/W	PWM Comparator 2	0x0000_0000
PWM_PDR2	0xFFF8_702C	R	PWM Data Register 2	0x0000_0000
PWM_CNR3	0xFFF8_7030	R/W	PWM Counter Register 3	0x0000_0000
PWM_CMR3	0xFFF8_7034	R/W	PWM Comparator Register 3	0x0000_0000
PWM_PDR3	0xFFF8_7038	R	PWM Data Register 3	0x0000_0000
PWM_PIER	0xFFF8_703C	R/W	PWM Interrupt Enable Register	0x0000_0000
PWM_PIIR	0xFFF8_7040	R/C	PWM Interrupt Indication Register	0x0000_0000

### KPI Control Register Map

REGISTER	ADDRESS	R/W	DESCRIPTION	RESET VALUE
KPICONF	0xFFFF8_8000	R/W	Keypad controller configuration Register	0x0000_0000
KPI3KCONF	0xFFFF8_8004	R/W	Keypad controller 3-keys configuration register	0x0000_0000
KPILPCONF	0xFFFF8_8008	R/W	Keypad controller low power configuration register	0x0000_0000
KPISTATUS	0xFFFF8_800C	R/O	Keypad controller status register	0x0000_0000

### PS2 Control Register Map

REGISTER	ADDRESS	R/W/C	DESCRIPTION	RESET VALUE
PS2CMD	0xFFFF8_9000	R/W	PS2 Host Controller Command Register	0x0000_0000
PS2STS	0xFFFF8_9004	R/W	PS2 Host Controller Status Register	0x0000_0000
PS2SCANCODE	0xFFFF8_9008	RO	PS2 Host Controller RX Scan Code Register	0x0000_0000
PS2ASCII	0xFFFF8_900C	RO	PS2 Host Controller RX ASCII Code Register	0x0000_0000

## Important Notice

Winbond products are not designed, intended, authorized or warranted for use as components in systems or equipment intended for surgical implantation, atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, or for other applications intended to support or sustain life. Further more, Winbond products are not intended for applications wherein failure of Winbond products could result or lead to a situation wherein personal injury, death or severe property or environmental damage could occur.

Winbond customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Winbond for any damages resulting from such improper use or sales.
