Simplified Device Schematic

Note 1:

Internal RF decoupling is included on all bias leads. No additional bypass elements are required, however some applications may require energy storage on the V_D leads to accommodate modulated signals.

Note 2:

Gate voltage must be applied to V_{GS} leads simultaneously with or after application of drain voltage to prevent potentially destructive oscillations. Bias voltages should never be applied to a module unless it is properly terminated on both input and output.

Note 3:

The required V_{GS} corresponding to a specific I_{DQ} will vary from module to module and may differ between V_{GS1} and V_{GS2} on the same module by as much as ±0.10 volts due to the normal die-to-die variation in threshold voltage. LDMOS transistors.

Note 4:

The threshold voltage (V_{GSTH}) of LDMOS transistors varies with device temperature. External temperature compensation may be required. See Sirenza application notes AN-067 LDMOS Bias Temperature Compensation.

Note 5:

This module was designed to have its leads hand soldered to an adjacent PCB. The maximum soldering iron tip temperature should not exceed 700° F, and the soldering iron tip should not be in direct contact with the lead for longer than 10 seconds. Refer to app note AN054 (www.sirenza.com) for further installation instructions.

Absolute Maximum Ratings
