## F<sup>2</sup>MC-16LX MB90860A Series

### MB90F867A (S) , MB90867A (S)

#### ■ DESCRIPTION

The MB90860A-series is Fujitsu 16-bit general-purpose microcontroller which enhances each kind of timers and communication macros. With the new 0.35  $\mu\text{m}$  CMOS technology, Fujitsu now offers 128 Kbytes on-chip FLASH-ROM program memory. An internal voltage booster removes the necessity for a second programming voltage.

The power supply (3 V) is supplied to the internal MCU core from an internal regulator circuit. This creates a major advantage in terms of EMI and power consumption.

The internal PLL clock frequency multiplier provides an internal 42 ns instruction cycle time from an external 4 MHz clock.

The unit features an 8 channel Output Compare Unit and 8 channel Input Capture Unit with 2 separate 16-bit free running timers. 4 UARTs constitute additional functionality for communication purposes.

Note : F<sup>2</sup>MC stands for FUJITSU Flexible Microcontroller, a registered trademark of FUJITSU LIMITED.

## ■ FEATURES

### • Clock

- Built-in PLL clock frequency multiplication circuit
- Selection of machine clocks (PLL clocks) is allowed among frequency division by two on oscillation clock, and multiplication of 1 to 6 times of oscillation clock (for 4 MHz oscillation clock, 4 MHz to 24 MHz).
- Operation by sub-clock (up to 50 kHz : 100 kHz oscillation clock divided by two) is allowed. (devices without S-suffix only)
- Minimum execution time of instruction : 42 ns (when operating with 4-MHz oscillation clock, and 6-time multiplied PLL clock).

### • 16 Mbyte CPU memory space

- 24-bit internal addressing

### • Instruction system best suited to controller

- Wide choice of data types (bit, byte, word, and long word)
- Wide choice of addressing modes (23 types)
- Enhanced multiply-divide instructions and RETI instructions
- Enhanced high-precision computing with 32-bit accumulator

### • Instruction system compatible with high-level language (C language) and multitask

- Employing system stack pointer
- Enhanced various pointer indirect instructions
- Barrel shift instructions

### • Increased processing speed

- 4-byte instruction queue

### • Powerful interrupt function

- Powerful 8-level, 34-condition interrupt feature
- Up to 16 external interrupts are supported

### • Automatic data transfer function independent of CPU

- Extended intelligent I/O service function (EI<sup>2</sup>OS) : up to 16 channels
- DMA : up to 16 channels

### • Low power consumption (standby) mode

- Sleep mode (a mode that halts CPU operating clock)
- Time-base timer mode (a mode that operates oscillation clock, sub clock, time-base timer and clock timer only)
- Watch mode (a mode that operates sub clock and clock timer only)
- Stop mode (a mode that stops oscillation clock and sub clock)
- CPU blocking operation mode

### • Process

- CMOS technology

### • I/O port

- General-purpose input/output port (CMOS output)
  - 80 ports (devices without S-suffix)
  - 82 ports (devices with S-suffix)

- **Timer**

- Time-base timer, clock timer, watchdog timer : 1 channel
- 8/16-bit PPG timer : 8-bit X 16 channels, or 16-bit X 8 channels
- 16-bit reload timer : 4 channels
- 16-bit input/output timer
  - 16-bit free run timer : 2 channel (FRT0 : ICU 0/1/2/3, OCU 0/1/2/3, FRT1 : ICU 4/5/6/7, OCU 4/5/6/7)
  - 16-bit input capture: (ICU) : 8 channels
  - 16-bit output compare : (OCU) : 8 channels

- **UART (LIN/SCI) : 4 channels**

- Equipped with full-duplex double buffer
- Clock-asynchronous or clock-synchronous serial transmission is available

- **I<sup>2</sup>C interface\* : 2 channels**

- Up to 400 kbit/s transfer rate

- **DTP/External interrupt : 16 channels, CAN wakeup : 2 channels**

- Module for activation of extended intelligent I/O service (EI<sup>2</sup>OS), DMA, and generation of external interrupt.

- **Delay interrupt generator module**

- Generates interrupt request for task switching.

- **8/10-bit A/D converter : 24 channels**

- Resolution is selectable between 8-bit and 10-bit.
- Activation by external trigger input is allowed.
- Conversion time : 3  $\mu$ s (at 24-MHz machine clock, including sampling time)

- **Program patch function**

- Address matching detection for 6 address pointers.

- **Internal voltage regulator**

- Supports 3 V MCU core, offering low EMI and low power consumption figures

- **Programmable input levels**

- Automotive/CMOS-Schmitt (initial level is Automotive in Single chip mode)
- TTL level (initial level for External bus mode)

- **ROM security function**

- Protects the content of ROM (MASK ROM device only)

- **Flash security function**

- Protects the content of Flash (Flash device only)

- **External bus interface**

- **Clock monitor function**

75 to 82	77 to 84	P00 to P07	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD00 to AD07		I/O pins for 8 lower bits of the external address/data bus. This function is enabled when the external bus is enabled.
		INT8 to INT15		External interrupt request input pins for INT8 to INT15.
83	85	P10	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD08		I/O pin for bit 8 of the external address/data bus. This function is enabled when the external bus is enabled.
		TIN1		Event input pin for the reload timer 1
84	86	P11	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD09		I/O pin for bit 9 of the external address/data bus. This function is enabled when the external bus is enabled.
		TOT1		Output pin for the reload timer 1
85	87	P12	N	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD10		I/O pin for bit 10 of the external address/data bus. This function is enabled when the external bus is enabled.
		SIN3		Serial data input pin for UART3
		INT11R		Sub external interrupt request input pin for INT11
86	88	P13	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD11		I/O pin for bit 11 of the external address/data bus. This function is enabled when the external bus is enabled.
		SOT3		Serial data output pin for UART3
87	89	P14	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD12		I/O pin for bit 12 of the external address/data bus. This function is enabled when the external bus is enabled.
		SCK3		Clock I/O pin for UART3

92	94	P15	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD13		I/O pin for bit 13 of the external address/data bus. This function is enabled when the external bus is enabled.
		SIN4		Serial data input pin for UART4 (MB90V340 only)
93	95	P16	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD14		I/O pin for bit 14 of the external address/data bus. This function is enabled when the external bus is enabled.
		SOT4		Serial data output pin for UART4 (MB90V340 only)
94	96	P17	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		AD15		I/O pin for bit 15 of the external address/data bus. This function is enabled when the external bus is enabled.
		SCK4		Clock I/O pin for UART4 (MB90V340 only)
95 to 98	97 to 100	P20 to P23	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. In external bus mode, the pin is enabled as a general-purpose I/O port when the corresponding bit in the external address output control register (HACR) is 1.
		A16 to A19		Output pins for A16 to A19 of the external address bus. When the corresponding bit in the external address output control register (HACR) is 0, the pins are enabled as high address output pins (A16 to A19).
		PPG9,PPGB,PPGD,PPGF		Output pins for PPGs
99 to 2	1 to 4	P24 to P27	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. In external bus mode, the pin is enabled as a general-purpose I/O port when the corresponding bit in the external address output control register (HACR) is 1.
		A20 to A23		Output pins for A20 to A23 of the external address bus. When the corresponding bit in the external address output control register (HACR) is 0, the pins are enabled as high address output pins (A20 to A23).
		IN0 to IN3		Data sample input pins for input captures ICU0 to ICU3
3	5	P30	G	General purpose I/O. The register can be set to select whether to use a pull-up resistor. This function is enabled in single-chip mode.
		ALE		Address latch enable output pin. This function is enabled when the external bus is enabled.

## ■ HANDLING DEVICES

Special care is required for the following when handling the device :

- Preventing latch-up
- Treatment of unused pins
- Using external clock
- Precautions for when not using a sub clock signal
- Notes on during operation of PLL clock mode
- Power supply pins ( $V_{CC}/V_{SS}$ )
- Pull-up/down resistors
- Crystal Oscillator Circuit
- Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs
- Connection of Unused Pins of A/D Converter
- Notes on Energization
- Stabilization of power supply voltage
- Initialization
- Port0 to port3 output during Power-on(**External-bus mode**)
- Flash security Function

### 1. Preventing latch-up

**CMOS IC chips may suffer latch-up under the following conditions :**

- A voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between  $V_{CC}$  and  $V_{SS}$ .
- The  $AV_{CC}$  power supply is applied before the  $V_{CC}$  voltage.

Latch-up may increase the power supply current drastically, causing thermal damage to the device.

For the same reason, also be careful not to let the analog power-supply voltage ( $AV_{CC}$ ,  $AVRH$ ) exceed the digital power-supply voltage.

### 2. Treatment of unused pins

Leaving unused input pins open may result in misbehavior or latch up and possible permanent damage of the device. Therefore they must be pulled up or pulled down through resistors. In this case those resistors should be more than 2 k $\Omega$  .

Unused bidirectional pins should be set to the output state and can be left open, or the input state with the above described connection.

### 3. Using external clock

To use external clock, drive the X0 pin and leave X1 pin open.

### 4. Precautions for when not using a sub clock signal

If you do not connect pins X0A and X1A to an oscillator, use pull-down handling on the X0A pin, and leave the X1A pin open.

## 5. Notes on during operation of PLL clock mode

If the PLL clock mode is selected, the microcontroller attempt to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.

## 6. Power supply pins ( $V_{CC}/V_{SS}$ )

- If there are multiple  $V_{CC}$  and  $V_{SS}$  pins, from the point of view of device design, pins to be of the same potential are connected the inside of the device to prevent such malfunctioning as latch up.

To reduce unnecessary radiation, prevent malfunctioning of the strobe signal due to the rise of ground level, and observe the standard for total output current, be sure to connect the  $V_{CC}$  and  $V_{SS}$  pins to the power supply and ground externally.

- Connect  $V_{CC}$  and  $V_{SS}$  to the device from the current supply source at a low impedance.
- As a measure against power supply noise, connect a capacitor of about 0.1  $\mu\text{F}$  as a bypass capacitor between  $V_{CC}$  and  $V_{SS}$  in the vicinity of  $V_{CC}$  and  $V_{SS}$  pins of the device

## 7. Pull-up/down resistors

The MB90860A Series does not support internal pull-up/down resistors (Port 0 to Port 3: built-in pull-up resistors). Use external components where needed.

## 8. Crystal Oscillator Circuit

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via shortest distance from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuit not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0 and X1 pins with a ground area for stabilizing the operation.

## 9. Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply ( $AV_{CC}$ ,  $AV_{RH}$ ,  $AV_{RL}$ ) and analog inputs ( $AN_0$  to  $AN_{23}$ ) after turning-on the digital power supply ( $V_{CC}$ ).

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage not exceed  $AV_{RH}$  or  $AV_{CC}$  (turning on/off the analog and digital power supplies simultaneously is acceptable).

## 10. Connection of Unused Pins of A/D Converter if A/D Converter is used

Connect unused pins of A/D converter to  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AV_{RH} = AV_{RL} = V_{SS}$ .

# MB90860A Series

## 11. Notes on Energization

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50  $\mu$ s or more (0.2 V to 2.7 V)

## 12. Stabilization of power supply voltage

A sudden change in the supply voltage may cause the device to malfunction even within the specified  $V_{CC}$  supply voltage operating range. Therefore, the  $V_{CC}$  supply voltage should be stabilized.

For reference, the supply voltage should be controlled so that  $V_{CC}$  ripple variations (peak-to-peak value) at commercial frequencies (50 Hz to 60 Hz) fall below 10% of the standard  $V_{CC}$  supply voltage and the coefficient of fluctuation does not exceed 0.1 V/ms at instantaneous power switching.

## 13. Initialization

In the device, there are internal registers which are initialized only by a power-on reset. To initialize these registers, turn on the power again.

## 14. Port 0 to port 3 output during Power-on (External-bus mode)

As shown below, when power is turned on in External-Bus mode, there is a possibility that output signal of Port 0 to Port 3 might be unstable.

## 15. Flash security Function

The security byte is located in the area of the flash memory.

If protection code 01<sub>H</sub> is written in the security byte, the flash memory is in the protected state by security.

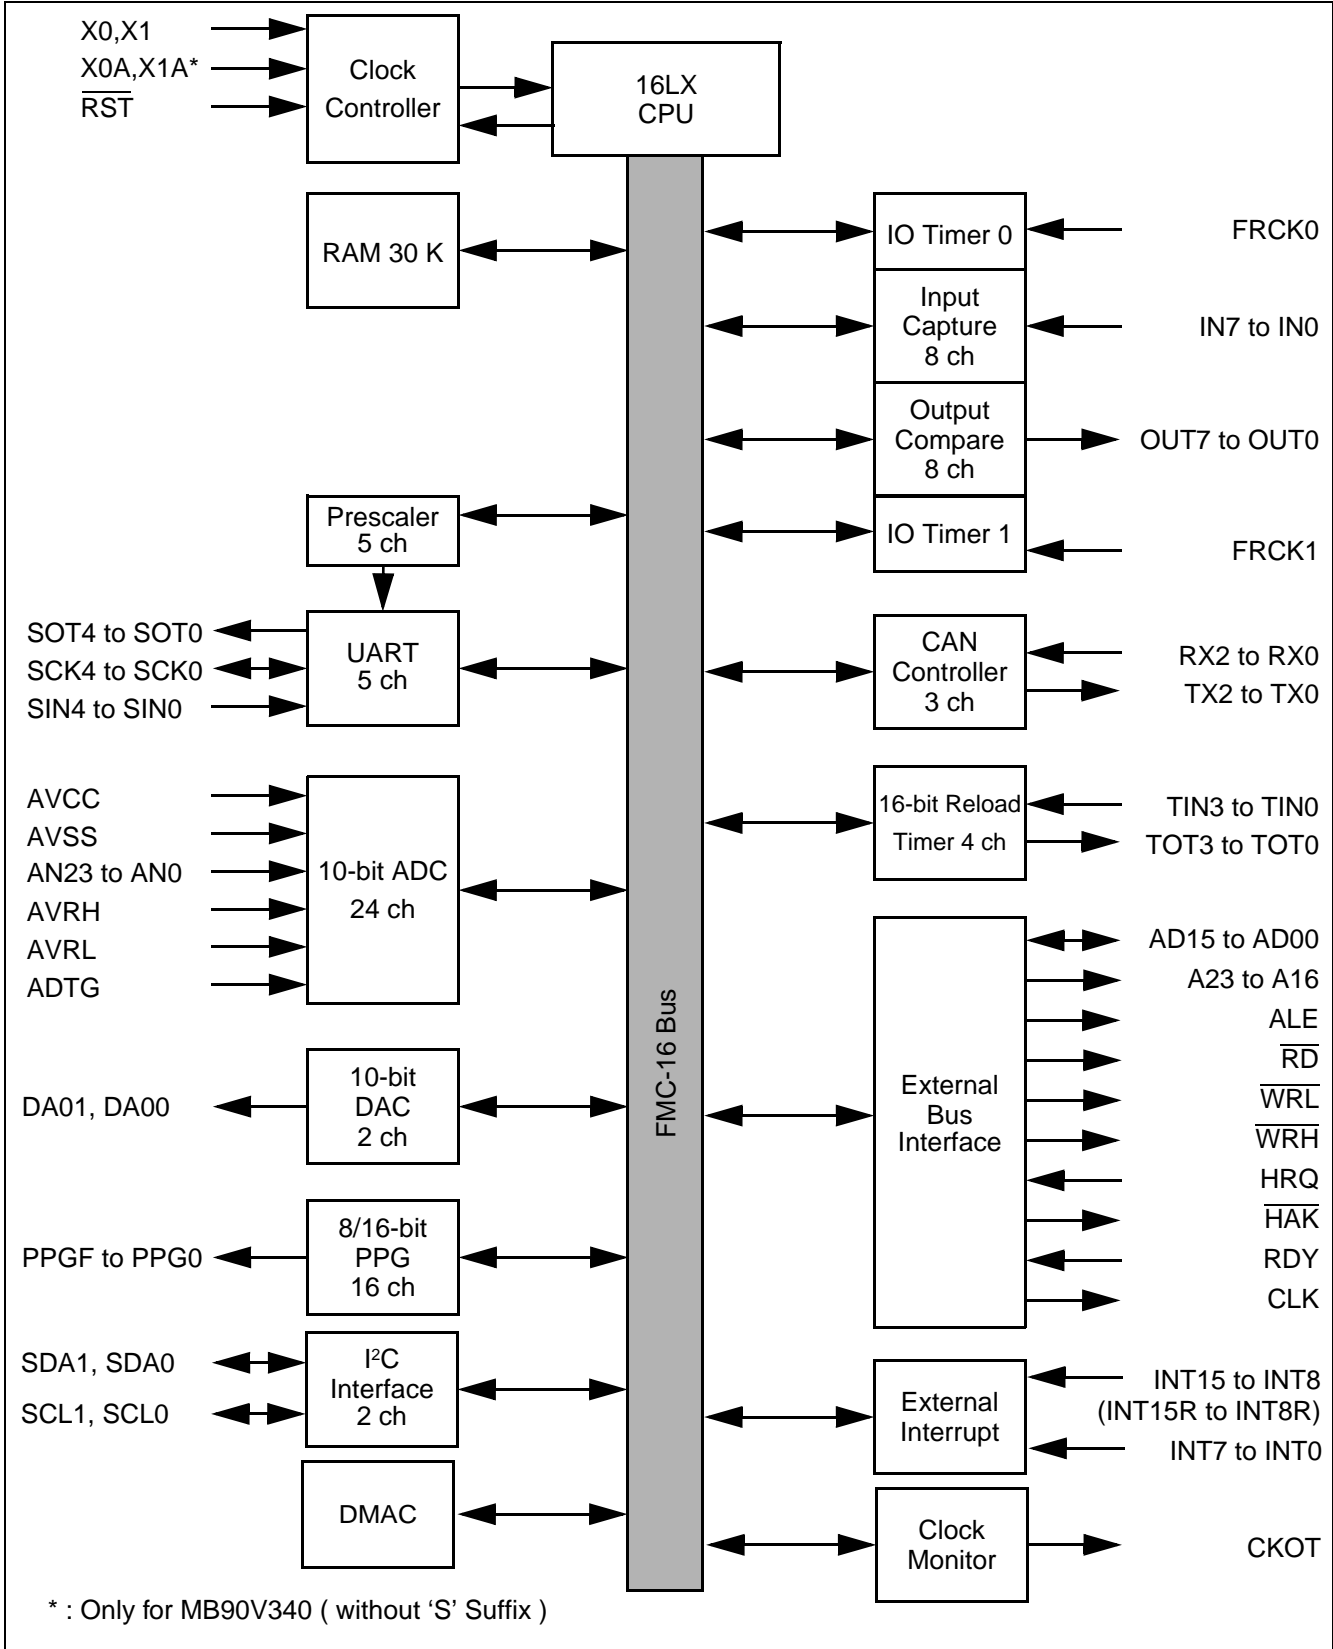

Therefore please do not write 01<sub>H</sub> in this address if you do not use the security function.

Please refer to following table for the address of the security byte.

	Flash memory size	Address for security byte

## MEMORY MAP

Note : The high-order portion of bank 00 gives the image of the FF bank ROM to make the small model of the C compiler effective. Since the low-order 16 bits are the same, the table in ROM can be referenced without using the far specification in the pointer declaration.

For example, an attempt to access 00C00H accesses the value at FFC00H in ROM.

The ROM area in bank FF exceeds 32 Kbytes, and its entire image cannot be shown in bank 00.

The image between FF800H and FFFFFH is visible in bank 00, while the image between FF000H and FF7FFFH is visible only in bank FF.

- \*1: Set  $AV_{CC}$  and  $V_{CC}$  to the same voltage. Make sure that  $AV_{CC}$  does not exceed  $V_{CC}$  and that the voltage at the analog inputs does not exceed  $AV_{CC}$  when the power is switched on.
- \*2:  $V_I$  and  $V_O$  should not exceed  $V_{CC} + 0.3$  V.  $V_I$  should not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the  $I_{CLAMP}$  rating supercedes the  $V_I$  rating.
- \*3: Applicable to pins: P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57, P60 to P67, P70 to P77, P80 to P87, P90 to P97, PA0 to PA1
- \*4:
  - Applicable to pins: P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57, P60 to P67, P70 to P77, P80 to P87, P90 to P97, PA0 to PA1
  - Use within recommended operating conditions.
  - Use at DC voltage (current)
  - The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
  - The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the  $V_{CC}$  pin, and this may affect other devices.
  - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V) , the power supply is provided from the pins, so that incomplete operation may result.
  - Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on reset.
  - Care must be taken not to leave the +B input pin open.
  - Sample recommended circuits:

- Input/output equivalent circuits

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Conditions

( $V_{SS} = AV_{SS} = 0\text{ V}$ )

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	$V_{CC}$ , $AV_{CC}$	4.0	5.0	5.5	V	Under normal operation
		3.5	5.0	5.5	V	Under normal operation, when not using the A/D converter and not Flash programming.
		4.5	5.0	5.5	V	When External bus is used.
		3.0	—	5.5	V	Maintains RAM data in stop mode
Smooth capacitor	$C_s$	0.1	—	1.0	$\mu\text{F}$	Use a ceramic capacitor or capacitor of better AC characteristics. Capacitor at the $V_{CC}$ should be greater than this capacitor.
Operating temperature	$T_A$	-40	—	+105	$^{\circ}\text{C}$	

**C Pin Connection Diagram**

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

			Min	Max		
Reset input time	$t_{RSTL}$	$\overline{RST}$	500	—	ns	Under normal operation
			Oscillation time of oscillator* + 100 $\mu\text{s}$		ns	In Stop mode, Sub Clock mode, Sub Sleep mode and Watch mode
			100	—	$\mu\text{s}$	In Time Timer mode

\* : Oscillation time of oscillator is the time that the amplitude reaches 90%.  
 In the crystal oscillator, the oscillation time is between several ms and to tens of ms. In FAR / ceramic oscillators, the oscillation time is between hundreds of  $\mu\text{s}$  to several ms. With an external clock, the oscillation time is 0 ms.

Power on rise time	$t_R$	$V_{CC}$	—	0.05	30	ms	
Power off time	$t_{OFF}$	$V_{CC}$	—	1	—	ms	Due to repetitive operation

If you change the power supply voltage too rapidly, a power on reset may occur. We recommend that you startup smoothly by restraining voltages when changing the power supply voltage during operation, as shown in the figure below. Perform while not using the PLL clock. However, if voltage drops are within 1 V/s, you can operate while using the PLL clock.

## 6. Definition of A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Non linearity error : Deviation between a line across zero-transition line ( “00 0000 0000” ← → “00 0000 0001” ) and full-scale transition line ( “11 1111 1110” ← → “11 1111 1111” ) and actual conversion characteristics.
- Differential linearity error : Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
- Total error : Difference between an actual value and an ideal value. A total error includes zero transition error, full-scale transition error, and linear error.
- Zero reading voltage : Input voltage which results in the minimum conversion value.
- Full scale reading voltage : Input voltage which results in the maximum conversion value.

$$\text{Total error of digital output "N"} = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \quad [\text{LSB}]$$

$$1 \text{ LSB} = (\text{Ideal value}) \frac{AVRH - AVRL}{1024} \quad [\text{V}]$$

$$V_{OT} (\text{Ideal value}) = AVRL + 0.5 \text{ LSB} \quad [\text{V}]$$

$$V_{FST} (\text{Ideal value}) = AVRH - 1.5 \text{ LSB} \quad [\text{V}]$$

V<sub>NT</sub> : A voltage at which digital output transitions from (N - 1) to N.

(Continued)

(Continued)

$$\text{Non linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ LSB [LSB]}$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

$V_{OT}$  : Voltage at which digital output transits from "000H" to "001H."  
 $V_{FST}$  : Voltage at which digital output transits from "3FEH" to "3FFH."

## 7. Notes on A/D Converter Section

Use the device with external circuits of the following output impedance for analog inputs :

Recommended output impedance of external circuits are : Approx. 1.5 kΩ or lower ( $4.0\text{ V} \leq AV_{CC} \leq 5.5\text{ V}$ , sampling period  $\leq 0.5\text{ }\mu\text{s}$ )

if the output impedance exceeds 1.5 kΩ, set a longer sampling time or add an external capacitor compensate the output impedance. About setting of sampling time, please refer to hardware manual of MB90860A series.

If an external capacitor is used, in consideration of the effect by tap capacitance caused by external capacitors and on-chip capacitors, capacitance of the external one is recommended to be several thousand times as high as internal capacitor.

If output impedance of an external circuit is too high, a sampling period for an analog voltage may be insufficient.
