Industrial Temp

256K x 18, 128K x 32, 128K x 36 180Mhz - 100Mhz
4Mb Sync Burst SRAMs 3.3V VDD
3.3V & 2.5V I/O

Features

- \overline{FT} pin for user configurable flow through or pipelined operation.
- Single Cycle Deselect (SCD) Operation.
- High Output Drive current.
- 3.3V +10%/-5% Core power supply
- 2.5V or 3.3V I/O supply.
- \overline{LBO} pin for linear or interleaved burst mode.
- Internal input resistors on mode pins allow floating mode pins.
- Default to Interleaved Pipelined Mode.
- Byte write (\overline{BW}) and/or global write (\overline{GW}) operation.
- Common data inputs and data outputs.
- Clock Control, registered, address, data, and control.
- Internal Self-Timed Write cycle.
- Automatic power-down for portable applications.
- JEDEC standard 100-lead TQFP or 119 Bump BGA package.

Flow Through 2-1-1-1	tkQ	8ns	8.5ns	10ns	12ns
	tCycle	10ns	10ns	10ns	15ns
	I _{DD}	190mA	190mA	190mA	140mA

Functional Description

Applications

The GS840H18/32/36 is a 4,718,592 bit (4,194,304 bit for x32 version) high performance synchronous SRAM with a 2 bit burst address counter. Although of a type originally developed for Level 2 Cache applications supporting high performance CPU s, the device now finds application in synchronous SRAM applications ranging from DSP main store to networking chip set support. The GS840H18/32/36 is available in a JEDEC standard 100-lead TQFP or 119 Bump BGA package.

Controls

Addresses, data I/O s, chip enables (\overline{E}_1 , E_2 , \overline{E}_3), address burst control inputs (ADSP, ADSC, ADV) and write control inputs (Bx, \overline{BW} , \overline{GW}) are synchronous and are controlled by a positive edge triggered clock input (CK). Output enable (\overline{G}) and power down control (ZZ) are asynchronous inputs. Burst cycles can be initiated with either ADSP or ADSC inputs. In Burst mode, subsequent burst addresses are generated internally and are controlled by ADV. The burst address counter may be configured to count in either linear or interleave order

with the Linear Burst Order (\overline{LBO}) input. The Burst function need not be used. New addresses can be loaded on every cycle with no degradation of chip performance.

Flow Through / Pipeline Reads

The function of the Data Output register can be controlled by the user via the \overline{FT} mode pin/bump (pin 14 in the TQFP and bump 5R in the BGA,). Holding the \overline{FT} mode pin/bump low places the RAM in Flow through mode, causing output data to bypass the Data Output Register. Holding \overline{FT} high places the RAM in Pipelined Mode, activating the rising edge triggered Data Output Register.

SCD Pipelined Reads

The GS840H18/32/36 is an SCD (Single Cycle Deselect) pipelined synchronous SRAM. DCD (Dual Cycle Deselect) versions are also available. SCD SRAMs pipeline deselect commands one stage less than read commands. SCD RAMs begin turning off their outputs immediately after the deselect command has been captured in the input registers.

Byte Write and Global Write

Byte write operation is performed by using byte write enable (\overline{BW}) input combined with one or more individual byte write signals (Bx). In addition, Global Write (\overline{GW}) is available for writing all bytes at one time, regardless of the Byte Write control inputs.

Sleep Mode

Low power (Sleep mode) is attained through the assertion (High) of the ZZ signal, or by stopping the clock (CK). Memory data is retained during Sleep mode.

Core and Interface Voltages

The GS840H18/32/36 operates on a 3.3V power supply and all inputs/outputs are 3.3V and 2.5V compatible. Separate output power (V_{DDQ}) pins are used to de-couple output noise from the internal circuit.

GS840H18/32/36 Block Diagram

Note: Only x36 version shown for simplicity.

Mode Pin Functions

Mode Name	Pin Name	State	Function
Burst Order Control	$\overline{\text{LBO}}$	L	Linear Burst
		H or NC	Interleaved Burst
Output Register Control	$\overline{\text{FT}}$	L	Flow Through
		H or NC	Pipeline
Power Down Control	ZZ	L or NC	Active
		H	Standby, $I_{DD} = I_{SB}$

Note:

There are pull up devices on $\overline{\text{LBO}}$ and $\overline{\text{FT}}$ pins and a pull down device on the ZZ pin, so those input pins can be unconnected and the chip will operate in the default states as specified in the above tables.

Burst Counter Sequences
Linear Burst Sequence

	A[1:0]	A[1:0]	A[1:0]	A[1:0]
1st address	00	01	10	11
2nd address	01	10	11	00
3rd address	10	11	00	01
4th address	11	00	01	10

Note: The burst counter wraps to initial state on the 5th clock.

Interleaved Burst Sequence

	A[1:0]	A[1:0]	A[1:0]	A[1:0]
1st address	00	01	10	11
2nd address	01	00	11	10
3rd address	10	11	00	01
4th address	11	10	01	00

Note: The burst counter wraps to initial state on the 5th clock.

Byte Write Truth Table

Function	$\overline{\text{GW}}$	$\overline{\text{BW}}$	$\overline{\text{B}}_A$	$\overline{\text{B}}_B$	$\overline{\text{B}}_C$	$\overline{\text{B}}_D$	Notes
Read	H	H	X	X	X	X	1
Read	H	L	H	H	H	H	1
Write byte A	H	L	L	H	H	H	2, 3
Write byte B	H	L	H	L	H	H	2, 3
Write byte C	H	L	H	H	L	H	2, 3, 4
Write byte D	H	L	H	H	H	L	2, 3, 4
Write all bytes	H	L	L	L	L	L	2, 3, 4
Write all bytes	L	X	X	X	X	X	

Note:

1. All byte outputs are active in read cycles regardless of the state of Byte Write Enable inputs.
2. Byte Write Enable inputs $\overline{\text{B}}_A$, $\overline{\text{B}}_B$, $\overline{\text{B}}_C$ and/or $\overline{\text{B}}_D$ may be used in any combination with $\overline{\text{BW}}$ to write single or multiple bytes.
3. All byte I/O s remain High-Z during all write operations regardless of the state of Byte Write Enable inputs.
4. Bytes C and D are only available on the x32 and x36 versions.

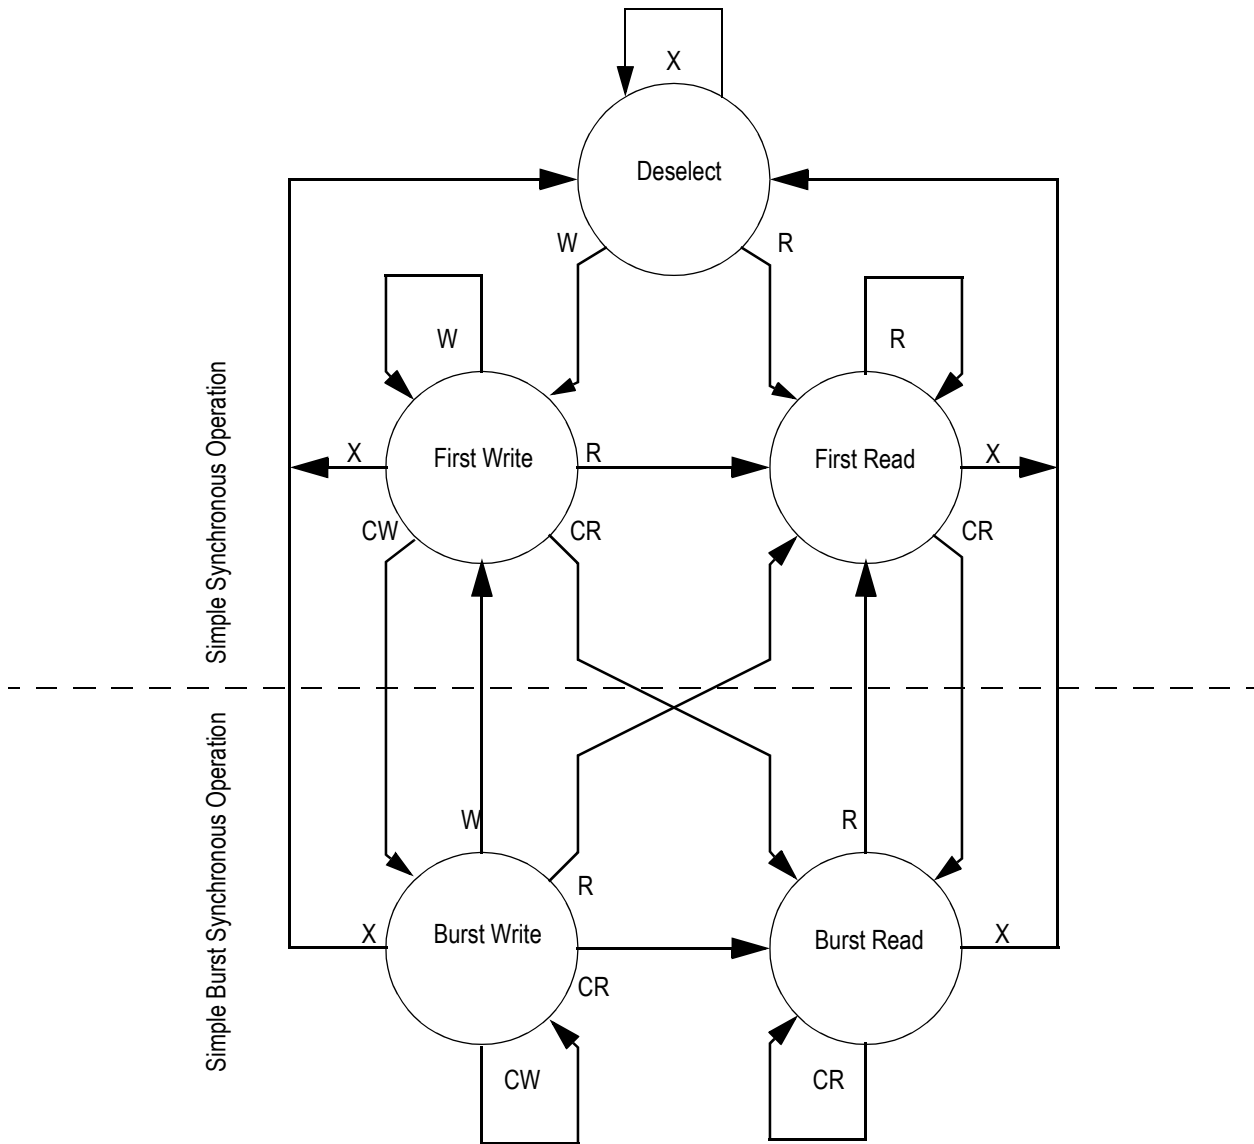

Synchronous Truth Table

Operation	Address Used	State Diagram Key ⁵	\bar{E}_1	E^2	\overline{ADSP}	\overline{ADSC}	\overline{ADV}	W^3	DQ^4
Deselect Cycle, Power Down	None	X	H	X	X	L	X	X	High-Z
Deselect Cycle, Power Down	None	X	L	F	L	X	X	X	High-Z
Deselect Cycle, Power Down	None	X	L	F	H	L	X	X	High-Z
Read Cycle, Begin Burst	External	R	L	T	L	X	X	X	Q
Read Cycle, Begin Burst	External	R	L	T	H	L	X	F	Q
Write Cycle, Begin Burst	External	W	L	T	H	L	X	T	D
<i>Read Cycle, Continue Burst</i>	<i>Next</i>	<i>CR</i>	<i>X</i>	<i>X</i>	<i>H</i>	<i>H</i>	<i>L</i>	<i>F</i>	<i>Q</i>
Read Cycle, Continue Burst	Next	CR	H	X	X	H	L	F	Q
<i>Write Cycle, Continue Burst</i>	<i>Next</i>	<i>CW</i>	<i>X</i>	<i>X</i>	<i>H</i>	<i>H</i>	<i>L</i>	<i>T</i>	<i>D</i>
Write Cycle, Continue Burst	Next	CW	H	X	X	H	L	T	D
Read Cycle, Suspend Burst	Current		X	X	H	H	H	F	Q
Read Cycle, Suspend Burst	Current		H	X	X	H	H	F	Q
Write Cycle, Suspend Burst	Current		X	X	H	H	H	T	D
Write Cycle, Suspend Burst	Current		H	X	X	H	H	T	D

Note:

1. X = Don't Care, H = High, L = Low.
2. E = T (True) if $E_2 = 1$ and $\bar{E}_3 = 0$; E = F (False) if $E_2 = 0$ or $\bar{E}_3 = 1$.
3. \bar{W} = T (True) and F (False) is defined in the Byte Write Truth Table preceding.
4. \bar{G} is an asynchronous input. \bar{G} can be driven high at any time to disable active output drivers. \bar{G} low can only enable active drivers (shown as Q in the Truth Table above).
5. All input combinations shown above are tested and supported. Input combinations shown in gray boxes need not be used to accomplish basic synchronous or synchronous burst operations and may be avoided for simplicity.
6. Tying \overline{ADSP} high and \overline{ADSC} low allows simple non-burst synchronous operations. See **BOLD** items above.
7. Tying \overline{ADSP} high and \overline{ADV} low while using \overline{ADSC} to load new addresses allows simple burst operations. See *ITALIC* items above.

Simplified State Diagram

Notes:

1. The diagram shows only supported (tested) synchronous state transitions. The diagram presumes \overline{G} is tied Low.
2. The upper portion of the diagram assumes active use of only the Enable ($\overline{E}_1, \overline{E}_2, \overline{E}_3$) and Write ($\overline{B}_A, \overline{B}_B, \overline{B}_C, \overline{B}_D, \overline{B}_W$ and \overline{G}_W) control inputs and that \overline{ADSP} is tied high and \overline{ADSC} is tied low.
3. The upper and lower portions of the diagram together assume active use of only the Enable, Write and \overline{ADSC} control inputs and assumes \overline{ADSP} is tied high and \overline{ADV} is tied low.

Simplified State Diagram with \overline{G}

Notes:

1. The diagram shows supported (tested) synchronous state transitions plus supported transitions that depend upon the use of \overline{G} .
2. Use of Dummy Reads (Read Cycles with \overline{G} High) may be used to make the transition from Read cycles to Write cycles without passing through a Deselect cycle. Dummy Read cycles increment the address counter just like normal Read cycles.
3. Transitions shown in grey tone assume \overline{G} has been pulsed high long enough to turn the RAM's drivers off and for incoming data to meet Data Input Set Up Time.

Absolute Maximum Ratings

 (All voltages reference to V_{SS})

Symbol	Description	Value	Unit
V_{DD}	Voltage on V_{DD} Pins	-0.5 to 4.6	V
V_{DDQ}	Voltage in V_{DDQ} Pins	-0.5 to V_{DD}	V
V_{CK}	Voltage on Clock Input Pin	-0.5 to 6	V
V_{IO}	Voltage on I/O Pins	-0.5 to $V_{DDQ}+0.5$ (≤ 4.6 V max.)	V
V_{IN}	Voltage on Other Input Pins	-0.5 to $V_{DD}+0.5$ (≤ 4.6 V max.)	V
I_{IN}	Input Current on Any Pin	+/- 20	mA
I_{OUT}	Output Current on Any I/O Pin	+/- 20	mA
P_D	Package Power Dissipation	1.5	W
T_{STG}	Storage Temperature	-55 to 125	$^{\circ}C$
T_{BIAS}	Temperature Under Bias	-55 to 125	$^{\circ}C$

Note:

Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Absolute Maximum Ratings, for an extended period of time, may affect reliability of this component.

Recommended Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Unit	Notes
Supply Voltage	V_{DD}	3.135	3.3	3.6	V	
I/O Supply Voltage	V_{DDQ}	2.375	2.5	V_{DD}	V	1
Input High Voltage	V_{IH}	1.7	---	$V_{DD}+0.3$	V	2
Input Low Voltage	V_{IL}	-0.3	---	0.8	V	2
Ambient Temperature (Commercial Range Versions)	T_A	0	25	70	$^{\circ}C$	3
Ambient Temperature (Industrial Range Versions)	T_A	-40	25	85	$^{\circ}C$	3

Note:

1. Unless otherwise noted, all performance specifications quoted are evaluated for worst case at both $2.75V \leq V_{DDQ} \leq 2.375V$ (i.e. 2.5V I/O) and $3.6V \leq V_{DDQ} \leq 3.135V$ (i.e. 3.3V I/O) and quoted at whichever condition is worst case.
2. This device features input buffers compatible with both 3.3V and 2.5V I/O drivers.
3. Most speed grades and configurations of this device are offered in both Commercial and Industrial Temperature ranges. The part number of Industrial Temperature Range versions end the character I. Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.
4. Input Under/overshoot voltage must be $-2V > V_i < V_{DD}+2V$ with a pulse width not to exceed 20% tKC.

Undershoot Measurement and Timing

Overshoot Measurement and Timing

Capacitance

($T_A=25^{\circ}\text{C}$, $f=1\text{MHz}$, $V_{DD}=3.3\text{V}$)

Parameter	Symbol	Test conditions	Typ.	Max.	Unit
Control Input Capacitance	C_I	$V_{DD}=3.3\text{V}$	3	4	pF
Input Capacitance	C_{IN}	$V_{IN}=0\text{V}$	4	5	pF
Output Capacitance	C_{OUT}	$V_{OUT}=0\text{V}$	6	7	pF

Note: This parameter is sample tested.

Package Thermal Characteristics

Rating	Layer Board	Symbol	TQFP Max	BGA Max	Unit	Notes
Junction to Ambient (at 200 lfm)	single	$R_{\Theta JA}$	40	38	$^{\circ}\text{C/W}$	1,2,4
Junction to Ambient (at 200 lfm)	four	$R_{\Theta JA}$	24	21	$^{\circ}\text{C/W}$	1,2,4
Junction to Case (TOP)		$R_{\Theta JC}$	9	5	$^{\circ}\text{C/W}$	3,4

Notes:

Notes:

- Junction temperature is a function of SRAM power dissipation, package thermal resistance, mounting board temperature, ambient. Temperature air flow, board density, and PCB thermal resistance.
- SCMI G-38-87.
- Average thermal resistance between die and top surface, MIL SPEC-883, Method 1012.1.
- For x18 configuration, consult factory.

AC Test Conditions

Parameter	Conditions
Input high level	2.3V
Input low level	0.2V
Input slew rate	1V/ns
Input reference level	1.25V
Output reference level	1.25V
Output load	Fig. 1& 2

Notes:

1. Include scope and jig capacitance.
2. Test conditions as specified with output loading as shown in Fig. 1 unless otherwise noted.
3. Output Load 2 for t_{LZ} , t_{HZ} , t_{OLZ} and t_{OHZ} .
4. Device is deselected as defined by the Truth Table.

* Distributed Test Jig Capacitance

DC Electrical Characteristics

Parameter	Symbol	Test Conditions	Min	Max
Input Leakage Current (except mode pins)	I_{IL}	$V_{IN} = 0 \text{ to } V_{DD}$	-1uA	1uA
ZZ Input Current	I_{INZZ}	$V_{DD} \geq V_{IN} \geq V_{IH}$ $0V \leq V_{IN} \leq V_{IH}$	-1uA -1uA	1uA 300uA
Mode Pin Input Current	I_{INM}	$V_{DD} \geq V_{IN} \geq V_{IL}$ $0V \leq V_{IN} \leq V_{IL}$	-300uA -1uA	1uA 1uA
Output Leakage Current	I_{OL}	Output Disable, $V_{OUT} = 0 \text{ to } V_{DD}$	-1uA	1uA
Output High Voltage	V_{OH}	$I_{OH} = -8\text{mA}$, $V_{DDQ} = 2.375\text{V}$	1.7V	
Output High Voltage	V_{OH}	$I_{OH} = -8\text{mA}$, $V_{DDQ} = 3.135\text{V}$	2.4V	
Output Low Voltage	V_{OL}	$I_{OL} = 8\text{mA}$		0.4V

	ZZ recovery	t _{ZZR}	20	---	20	---	20	---	20	---	ns

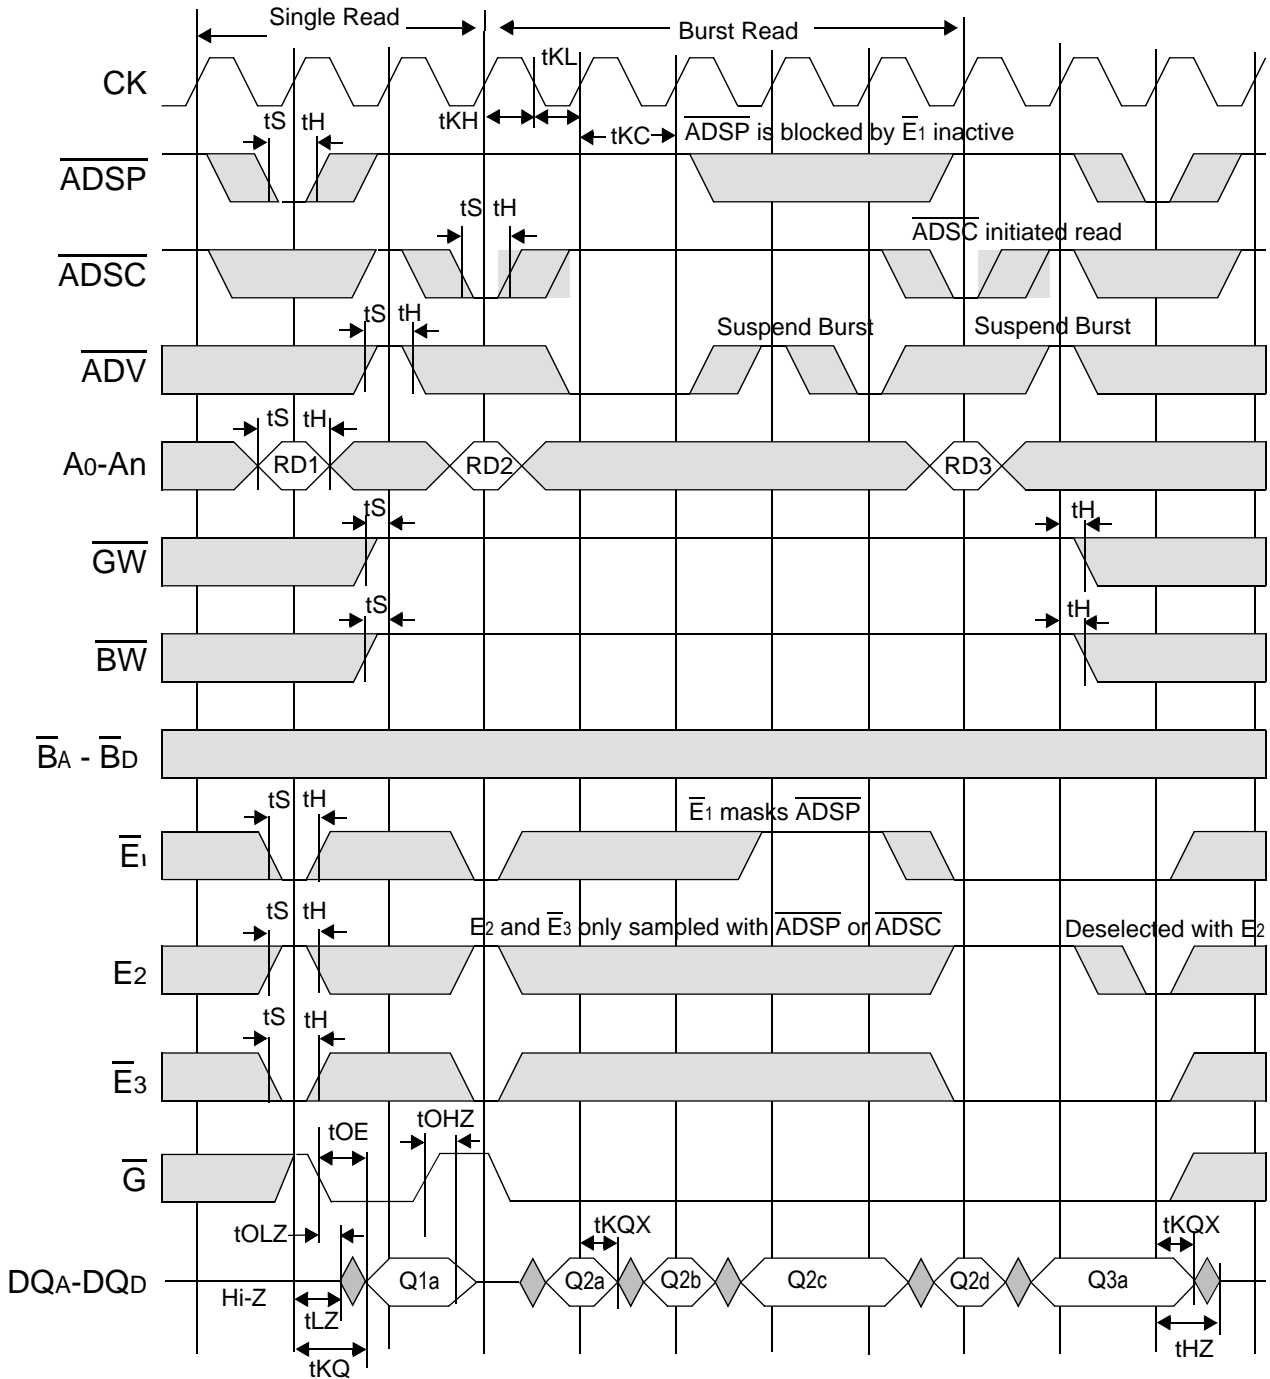

Notes:

1. These parameters are sampled and are not 100% tested
2. ZZ is an asynchronous signal. However, In order to be recognized on any given clock cycle, ZZ must meet the specified setup and hold times as specified above.

Sleep Mode Timing Diagram

Application Tips

Single and Dual Cycle Deselect

SCD devices force the use of dummy read cycles (read cycles that are launched normally but that are ended with the output drivers inactive) in a fully synchronous environment. Dummy read cycles waste performance but their use usually assures there will be no bus contention in transitions from reads to writes or between banks of RAMs. DCD SRAMs do not waste bandwidth on dummy cycles and are logically simpler to manage in a multiple bank application (wait states need not be inserted at bank address boundary crossings) but greater care must be exercised to avoid excessive bus contention.

GS 840H18/32/36 Output Driver Characteristics

TQFP Package Drawing

Symbol	Description	Min.	Nom.	Max
A1	Standoff	0.05	0.10	0.15
A2	Body Thickness	1.35	1.40	1.45

Notes:

- Customers requiring delivery in Tape and Reel should add the character T to the end of the part number. Example: GS84032T-7.5T.
- The speed column indicates the cycle frequency (Mhz) of the device in Pipelined mode and the latency (ns) in Flow Through mode. Each device is Pipeline / Flow through mode selectable by the user.
- T_A = C = Commercial Temperature Range. T_A = I = Industrial Temperature Range.
- GSI offers other versions this type of device in many different configurations and with a variety of different features, only some of which are covered in this data sheet. See the GSI Technology web site for a complete listing of current offerings.
