Chapter 1

Describing the LSI8751D

This chapter describes how the LSI8751D PCI to SCSI Host Adapter interfaces to PCI computer systems and includes these topics:

- [Section 1.1, “General Description,” page 1-1](#)
- [Section 1.2, “Features,” page 1-2](#)

1.1 General Description

The LSI8751D provides a SCSI-3, Ultra SCSI interface to PCI computer systems. Installing this adapter in your PCI system allows you to connect SCSI devices over a SCSI bus.

The LSI8751D is a 16-bit, High Voltage Differential (HVD), Ultra SCSI solution for your computer, using only one PCI slot. This board can support both legacy Fast SCSI devices and the newest Ultra SCSI devices. It is also backward compatible with the existing LSI8251D host adapter.

The Storage Device Management System (SDMS™) software operates the board, but the design of the board does not prevent other software from being written and used with it.

This guide and the *PCI Storage Device Management System SDMS 4.0 User's Guide* contain product information and installation instructions. This information helps you gain the full benefits of the LSI8751D for your computer system.

1.2 Features

This section provides an overview of the PCI interface, the SCSI interface, and board characteristics for the LSI8751D.

BIOS support for this host adapter is incorporated on the board in an 8 x 64 Kbytes Flash BIOS.

1.2.1 PCI Interface

PCI is a high-speed standard local bus for interfacing a number of I/O components to the processor and memory subsystems in a high-end PC. The PCI functionality for the LSI8751D is contained within the LSI53C875J PCI to SCSI I/O Processor chip. The LSI53C875J connects directly to the PCI bus and generates timing protocol that complies with the PCI specification.

The PCI interface on the LSI8751D supports these features:

- Full 32-bit DMA bus master
- Zero wait-state bus master data bursts
- Universal 5 V or 3.3 V PCI bus voltage
- *PCI Local Bus Specification, Revision 2.1* compliance

1.2.2 SCSI Interface

The SCSI functionality for the LSI8751D is contained within the LSI53875 controller chip. The LSI53C875 connects directly to the SCSI bus and generates timing and protocol in compliance with the SCSI standard.

The SCSI interface on the LSI8751D operates as a 16-bit, synchronous or asynchronous, HVD bus, and supports Ultra SCSI protocols and 16-bit arbitration. The LSI8751D provides HVD SCSI termination as a pluggable terminator. This terminator plugs into either the internal or external 68-pin high density connector (J2 or J3).

The SCSI interface for this board supports these features:

- 16-bit HVD
- External plug-in termination supplied with board

- 68-pin high density external dual connector
- 68-pin high density internal dual connector
- Fast and Ultra SCSI data transfer capability
- SCSI termination power (TERMPWR) source with autoresetting circuit breaker
- Flash EEPROM for BIOS storage
- Serial NonVolatile Random Access Memory (NVRAM) for user configuration utility.
- SCSI activity LED connector

1.2.3 Board Characteristics

The board characteristics are

- PCI host adapter dimensions –
5.00 x 3.25 inches (127 X82.552 mm)
- Universal 32-bit card edge connector

1.2.4 Ultra SCSI

The LSI8751D has full support for Ultra SCSI and simultaneously supports Fast SCSI. Ultra SCSI is an extension of the SCSI-3 family of standards that expands the bandwidth of the SCSI bus, allowing faster synchronous data transfers. Special SCSI cables are specified for operation with Ultra SCSI devices, and you must consider the total number of devices and the length of your SCSI bus when setting up your system. See [Section 1.2.3, “Connecting the SCSI Peripherals,” page 1-5](#) for a more detailed explanation of SCSI bus connections.

Chapter 2

Installing the LSI8751D

This chapter provides instructions on how to install the LSI8751D and includes these topics:

- [Section 2.1, “Quick Installation Procedure,” page 2-1](#)
- [Section 2.2, “Detailed Installation Procedure,” page 2-2](#)
- [Section 2.3, “Completing the Installation,” page 2-21](#)

2.1 Quick Installation Procedure

This section provides quick setup instructions for the experienced computer user with prior host adapter installation and SCSI bus setup experience. If you prefer more detailed guidance for installing the LSI8751D, please follow the instructions in [Section 2.2, “Detailed Installation Procedure.”](#)

For safe and proper installation, check the user’s manual supplied with your computer and perform the following steps.

Step 1. *Ground yourself* before handling this host adapter board, then remove the cabinet cover on your computer to access the PCI slots.

Note: The use of a static ground strap is recommended.

Step 2. Remove the LSI8751D from the packing and check that it is not damaged.

Step 3. Turn off and unplug your system.

Step 4. Open your PC cabinet.

Step 5. Locate the slots for installing a PCI plug-in board.

Step 6. Insert the LSI8751D board into the selected PCI slot.

- Step 7. Connect the internal and external SCSI peripherals.
Optional: Connect the LED cable on your SCSI host adapter.
- Step 8. Terminate the SCSI bus.
The SCSI bus requires proper termination and no duplicate SCSI IDs.
- Step 9. Set the peripheral SCSI IDs.
- Step 10. Make any configuration changes.
- Step 11. Replace your PC cabinet cover.
- Step 12. Plug in your computer and peripherals.
- Step 13. Turn on the peripherals, and then your computer.
The host adapter installation is complete.

Refer to the *PCI Storage Device Management System SDMS 4.0 User's Guide* (or the guide for the software you will use) to load the driver software for your particular operating system. Additionally, this guide contains documentation about the SCSI BIOS Configuration Utility, which provides a means to change system configuration.

2.2 Detailed Installation Procedure

This section provides step-by-step instructions for installing the LSI8751D and connecting it to your SCSI peripherals. If you are experienced in these tasks, you may prefer to use the instructions in the preceding [Section 2.1, "Quick Installation Procedure."](#)

2.2.1 Before You Start

Before starting, read through the steps defined within the detailed installation procedure. If you are not confident that you can perform the tasks as described in this section, LSI Logic suggests getting assistance.

The SCSI host adapter acts on your computer's behalf as the host to your suite of SCSI peripherals. Each chain of SCSI peripheral devices and their host adapter work together and are referred to as a SCSI bus.

Each channel on your SCSI host adapter can act as host for up to 15 peripheral devices, not including the adapter itself.

2.2.2 Inserting the Host Adapter

For safe and proper installation, check the user's manual supplied with your computer and perform the following steps.

- Step 1. *Ground yourself* before handling this host adapter board. Remove the LSI8751D from the packing and check that it is not damaged. [Figure 2.1](#) shows an example of this board.

Figure 2.1 Hardware Connections for the LSI8751D

- Step 2. Switch off and unplug power cords for all components in your system.
- Step 3. Remove the cabinet cover on your computer to access the PCI slots.

Caution: Ground yourself by touching a metal surface before removing the cabinet cover. Static charges on your body can damage electronic components. Handle plug-in boards

by the edge; do not touch board components or gold connector contacts. The use of a static ground strap is recommended.

- Step 4. Locate the slots for PCI plug-in board installation. Refer to the user's manual for your computer to confirm the location of the PCI slots. The LSI8751D requires a PCI slot which allows bus master operation.
- Step 5. Remove the blank panel on the back of the computer aligned with the PCI slot you intend to use. Save the bracket screw.
- Step 6. Carefully insert the edge connector J1 (see [Figure 2.1](#)) of the host adapter into the PCI slot. Make sure the edge connector is properly engaged before pressing the board into place as shown in [Figure 2.2](#). You may notice that the components on a PCI host adapter face the opposite way from those on other non-PCI adapter boards you have in your system. This is correct, and the board is keyed to go in only one way.

Figure 2.2 Inserting the Host Adapter

Step 7. The bracket around the connectors J3 (see [Figure 2.1](#)) should fit in the slot where you removed the blank panel. Secure the bracket with the bracket screw (see [Figure 2.2](#)) before making the internal and external SCSI bus connections.

2.2.3 Connecting the SCSI Peripherals

SCSI bus connections to the LSI8751D inside your computer are made with an unshielded, 68-conductor ribbon cable (see [Figure 2.3](#)). One side of this cable is marked with a color to indicate the pin-1 side. Sometimes the connectors on this cable are keyed to ensure proper pin-1 connection.

All external SCSI bus connections to the LSI8751D are made with shielded, 68-conductor cables (see [Figure 2.3](#)). The connectors on this cable are always keyed to ensure proper pin-1 connection.

[Table 2.1](#) lists the SCSI bus widths and speeds as established by the SCSI Trade Association (STA).

Table 2.1 SCSI Bus Widths and Speeds

STA Terms	SCSI Bus Width, Bits	SCSI Bus Speed Maximum Data Rate, Mbytes/s
SCSI-1	8	5
Fast SCSI	8	10
Fast Wide SCSI	16	20
Ultra SCSI	8	20
Wide Ultra SCSI	16	40
Ultra2 SCSI	8	40
Wide Ultra2 SCSI	16	80

Important: Use only cables designed and specified for operation with Ultra SCSI devices to make connections to the LSI8751D. See [Figure 2.3](#) for an example of the required cables.

Figure 2.3 SCSI Cables

SCSI Cable for Internal Connections

SCSI Cable for External Connections

2.2.3.1 Making Internal SCSI Bus Connections

This section provides step-by-step instructions for making internal SCSI bus connections:

- Step 1. To connect an internal SCSI device, plug the 68-pin connector on one end of the internal SCSI ribbon cable into the connector J2. Make certain to match pin 1 on both connectors. [Figure 2.4](#) shows an example of this connection.

Figure 2.4 Internal SCSI Ribbon Cable to Host Adapter Connection

Step 2. Plug the 68-pin connector on the other end of the internal SCSI ribbon cable into the SCSI connector on your internal SCSI device. (See [Figure 2.5.](#)) Make sure to match pin 1 on all connections.

Figure 2.5 Internal SCSI Ribbon Cable to Internal SCSI Device Connection

Step 3. Connect additional internal SCSI devices by using an internal SCSI ribbon cable with the required number of 68-pin connectors attached along its length as shown in [Figure 2.6.](#)

Figure 2.6 Connecting Additional Internal SCSI Devices

Figure 2.7 shows an example of this type of chained connection. Make sure to match pin 1 on all connections.

Figure 2.7 Multiple Internal SCSI Devices Chained Together

Step 4. Most PC cabinets are designed with a front panel LED, which may already be connected to an existing IDE drive. Connect this LED cable to connector J4 on the host adapter, as shown in [Figure 2.8](#). This allows the front panel LED to indicate activity on the SCSI bus. Connector J4 is not keyed. The orientation of the LED cable does not matter as long as all four pins are connected.

Figure 2.8 SCSI LED Connector

Some LED cables have only two wires. In this case, place the connector on one end or the other of J4. If the LED does not light during SCSI bus activity from this host adapter, you may have to rotate the LED cable 180° on J4.

2.2.3.2 Making External SCSI Bus Connections

This section provides step-by-step instructions for making external SCSI bus connections:

- Step 1. To connect external SCSI devices to the LSI8751D, plug the 68-pin connector on one end of a shielded external SCSI cable (see [Figure 2.3](#)) into the host adapter connector J3 (see [Figure 2.1](#)).

This connector is now bracketed to the back panel of your computer. [Figure 2.9](#) shows how this connection is made.

Figure 2.9 External Cable to Host Adapter

Step 2. Plug the 68-pin connector on the other end of the shielded external SCSI cable into the SCSI connector on the external SCSI device. [Figure 2.10](#) shows an example of this connection.

Figure 2.10 External Cable to External SCSI Device

Step 3. To connect more than one external SCSI device to the host adapter, you must chain them together with shielded external SCSI cables. [Figure 2.11](#) shows an example of these chained connections.

Figure 2.11 Multiple External SCSI Devices Chained Together

2.2.4 SCSI Bus Termination

The devices making up the SCSI bus are connected serially (chained together) with SCSI cables. The first and last physical SCSI devices connected on the ends of the SCSI bus must have a set of resistors called terminators. All other SCSI devices on the bus must have their terminators removed or disabled. Remember that the LSI8751D is also on the SCSI bus; if you position the host adapter at the end of the SCSI bus, you must place the supplied HVD terminator on the unused connector (J2 or J3).

The peripheral device terminators are usually set with jumpers, resistor modules, or a switch on the peripheral. Refer to the peripheral manufacturer's instructions and to the user's manual for your computer for information on how to identify the terminator setting of each device and how to change it.

The LSI8751D automatically covers SCSI bus termination for three different bus configurations, depending on the use of the connectors J2 and J3 on the LSI8751D (see [Figure 2.1](#)). The three bus configurations are

- only for internal SCSI connections to connector J2
- only for external SCSI connections to connector J3
- for SCSI connections to both J2 and J3 connectors

Termination on the LSI8751D for these three different bus configurations is discussed in the following sections.

2.2.4.1 Internal SCSI Connections

If you make only internal SCSI device connections to the host adapter, you must terminate the last internal device on the SCSI bus. You must disable the termination on all other devices. Termination on the host adapter is required in this case. Insert the plug-in HVD terminator into the external connector J3 on the host adapter.

[Figure 2.12](#) shows an example of how termination is determined for this SCSI bus configuration.

Figure 2.12 Internal SCSI Device Termination

2.2.4.2 External SCSI Connections

If you make only external SCSI device connections to the host adapter, you must terminate the last external device on the SCSI bus. You must disable the termination on all other devices. Termination on the host adapter is required in this case. Insert the plug-in HVD terminator into the internal connector J2 on the host adapter.

Figure 2.13 shows you how to enable or disable termination for this SCSI bus configuration.

Figure 2.13 External SCSI Device Termination

2.2.4.3 Internal and External SCSI Connections

If you make internal and external SCSI device connections to the host adapter, you must terminate the last internal device and external device on the SCSI bus. You must disable the termination on all other devices. Termination on the host adapter is not required in this case. Save the plug-in HVD terminator so you can change the SCSI bus configuration in the future.

[Figure 2.14](#) shows you how to enable or disable termination for this SCSI bus configuration.

Figure 2.14 Internal and External SCSI Device Termination

2.2.5 Setting SCSI IDs

Each SCSI device and the host adapter must have a separate SCSI ID, 0 through 15. SCSI ID 7 is the preset host adapter setting, giving it the highest priority on the SCSI bus. If you plan to boot your computer from a SCSI hard disk drive on the SCSI bus, that drive should have SCSI ID 0, or the lowest SCSI ID on the bus. The *PCI Storage Device Management System SDMS 4.0 User's Guide* explains how to set your host adapter ID using the SCSI BIOS Configuration Utility.

The peripheral device SCSI IDs are usually set with jumpers or with a switch on the peripheral. Refer to the peripheral manufacturer's instructions and to the user's manual for your computer to determine the ID of each device and how to change it. No duplication of SCSI IDs is allowed on a SCSI bus. Follow these steps for setting SCSI IDs:

- Step 1. Determine the SCSI ID of each device on the SCSI bus. Note any duplications.
- Step 2. Make any necessary changes to the SCSI IDs and record the IDs for future reference. Correct any duplications at this time. [Table 2.2](#) is provided as a place to keep this record.

Chapter 3

Technical Specifications

This section discusses the physical environment associated with the LSI8751D. The LSI8751D mechanical drawing is shown in [Figure 1.1](#). This section also includes these topics:

- [Section 1.1, “Physical Environment,” page 1-1](#)
 - [Section 1.2, “Operational Environment,” page 1-3](#)
-

3.1 Physical Environment

This section discusses the physical, electrical, thermal, and safety characteristics of the LSI8751D. This board complies with electromagnetic standards set by the FCC.

3.1.1 Physical Characteristics

The dimensions of the LSI8751D are 5.00 x 3.25 inches (127 x 82.552 mm). PCI connection is made through the edge connector J1. Internal SCSI connection is made through the 68-pin high density connector J2. External SCSI connection is made through the 68-pin high density connector J3. The J3 connector extends through the standard bracket, which is attached to the face of the connector outside of the cabinet where the LSI8751D is installed. The bracket is a standard type with a cutout to accommodate connector J3. The J4 connector is for the Busy LED connection using a 4-pin, one-row right-angle header. The component height on the top and bottom of the board follows the PCI specification.

Figure 3.1 LSI8751D Mechanical Drawing

All dimensions are given in millimeters and (inches).

3.1.2 Electrical Characteristics

The LSI8751D maximum power requirements, including SCSI TERMPWR, under normal operation, are shown in [Table 1.1](#):

Table 3.1 Maximum Power Requirements

+5 V DC	±5%	1.5 A	Over the operating range 5 °C to 55 °C
+3.3 V DC	±0.3 V	130 mA	Over the operating range 5 °C to 55 °C when operating in a 3.3 V PCI slot

Under abnormal conditions, such as a short on SCSI TERMPWR, +5 V current may be higher. At temperatures of at least 25 °C, a current of 4 A is sustained no longer than 30 seconds before the self-resetting TERMPWR short circuit protection device opens.

The PCI PRSNT1/ and PRSNT2/ pins are set to indicate a 7.5 W maximum configuration.

3.1.3 Thermal, Atmospheric Characteristics

The board operates in an environment defined by the following parameters:

- Temperature range: 5 to 55 °C (dry bulb)
- Relative humidity range: 5 to 90% noncondensing
- Maximum dew point temperature: 32 °C

3.1.4 Electromagnetic Compliance

The board minimizes electromagnetic emissions, susceptibility to radio frequency energy, and the effects of electromagnetic discharge. The board meets the requirements of FCC and CISPR Class B limits and is marked with the FCC Class B ID: B8J8251AD.

3.1.5 Safety Characteristics

The bare board meets or exceeds the requirements of UL flammability rating 94 V0. The bare board is also marked with the supplier's name or trademark, type, and UL flammability rating. Because this board is installed in a PCI bus slot, all voltages are below the SELV 42.4 V limit.

3.2 Operational Environment

The LSI8751D is designed for PCI computer systems with a standard bracket. The SDMS software operates the board, but the design of the board does not prevent the use of other software.

3.2.1 The PCI Interface

The PCI interface operates as a 32-bit DMA bus master. The connection is made through the edge connector J1, which provides connections on both the top and bottom of the board. The signal definitions and pin numbers conform to the PCI Local Bus Specification Revision 2.1 standard. The signal assignments are shown in [Table 1.2](#) and [Table 1.3](#).

Note: The + 3.3 V pins are tied together and decoupled with high frequency bypass capacitors to ground. No current from these 3.3 V pins is used on the board. The PCI portion of the LSI53C875J chip is powered from the 3 V/5 V pins.

3.2.2 The SCSI Interface

The SCSI interface operates as 16-bit, synchronous or asynchronous, High Voltage Differential (HVD) bus, and supports SCSI-3 protocols and 16-bit arbitration. The signal definitions conform to the SCSI-2 differential standard. The interface is made through connectors J2 and J3. Connector J2 is a 68-pin, high density, right-angle receptacle used for internal connections. Connector J3 is a 68-pin, high density, right-angle receptacle that protrudes through the back panel bracket. SCSI termination is provided through a HVD plug-in terminator. SCSI termination power is also supplied by the board. [Table 1.4](#) shows the signal assignments for J2 and J3 SCSI HVD connectors.

3.2.3 The LED Interface

The LED interface on the LSI8751D is a four-wire arrangement that allows the user to connect an LED harness to the board. The GPIO0_FETCH line (maximum output low voltage 0.4 V and minimum output low current 16 mA) is pulled low to complete the circuit when a harness with an LED is attached. The connector on the LSI8751D is J4.

Asynchronous Data Transfer	One of the ways data is transferred over the SCSI bus. It is slower than synchronous data transfer.
BIOS	Basic Input/Output System. Software that provides basic read/write capability. Usually kept as firmware (ROM based). The system BIOS on the mainboard of a computer is used to boot and control the system. The SCSI BIOS on your host adapter acts as an extension of the system BIOS.

Bus	A collection of unbroken signal lines across which information is transmitted from one part of a computer system to another. Connections to the bus are made by way of taps on the lines.
Bus Mastering	A high-performance way to transfer data. The host adapter controls the transfer of data directly to and from system memory without interrupting the computer's microprocessor. This is the fastest way for multitasking operating systems to transfer data.

DMA Bus Master	A feature that allows a peripheral to control the flow of data to and from system memory by blocks, as opposed to PIO (Programmed I/O) where the processor is in control and the flow is by byte.
Device Driver	A program that allows a microprocessor (through the operating system) to direct the operation of a peripheral device.
Differential SCSI	A hardware configuration for connecting SCSI devices. It uses a pair of lines for each signal transfer (as opposed to single-ended SCSI which references each SCSI signal to a common ground). Two types of differential signals in the industry are High Voltage Differential (HVD) and Low Voltage Differential (LVD).
Dword	A double word is a group of four consecutive bytes or characters that are stored, addressed, transmitted, and operated on as a unit. The lower two address bits of the least significant byte must equal zero in order to be Dword aligned.
EEPROM	Electrically Erasable Programmable Read Only Memory. A memory chip typically used to store configuration information. See NVRAM.
EISA	Extended Industry Standard Architecture. An extension of the 16-bit ISA bus standard. It allows devices to perform 32-bit data transfers.

Fast SCSI	A standard for SCSI data transfers. It allows a transfer rate of up to 10 Mbytes/s over an 8-bit SCSI bus and up to 20 Mbytes/s over a 16-bit SCSI bus.
FCC	Federal Communications Commission.
File	A named collection of information stored on a disk.
Firmware	Software that is permanently stored in ROM. Therefore, it can be accessed during boot time.
Hard Disk	A disk made of metal and permanently sealed into a drive cartridge. A hard disk can store very large amounts of information.

Host Adapter	A circuit board or integrated circuit that provides a SCSI bus connection to the computer system.
Internal SCSI Device	A SCSI device installed inside the computer cabinet. These devices are connected in a continuous chain using an unshielded ribbon cable.
IRQ	Interrupt Request Channel. A path through which a device can get the immediate attention of the computer's CPU. The PCI bus assigns an IRQ path for each SCSI host adapter.
ISA	Industry Standard Architecture. A type of computer bus used in most PCs. It allows devices to send and receive data up to 16-bits at a time.
Kbyte	Kilobyte. A measure of computer storage equal to 1024 bytes.
Local Bus	A way to connect peripherals directly to computer memory. It bypasses the slower ISA and EISA buses. PCI is a local bus standard.
Logical Unit	A subdivision, either logical or physical, of a SCSI device (actually the place for the device on the SCSI bus). Most devices have only one logical unit, but up to eight are allowed for each of the eight possible devices on a SCSI bus.
LUN	Logical Unit Number. An identifier, zero to seven, for a logical unit.

LVD SCSI	Low Voltage Differential. LVD is a robust design methodology that improves power consumption, data integrity, cable lengths and support for multiple devices, while providing a migration path for increased I/O performance.

Main Memory	The part of a computer's memory which is directly accessible by the CPU (usually synonymous with RAM).
Mbyte	Megabyte. A measure of computer storage equal to 1024 kilobytes.
Motherboard	See Mainboard. In some countries, the term Motherboard is not appropriate.
Multitasking	The executing of more than one command at the same time. This allows programs to operate in parallel.
Multithreading	The simultaneous accessing of data by more than one SCSI device. This increases the data throughput.
NVRAM	NonVolatile Random Access Memory. Actually an EEPROM (Electrically Erasable Read Only Memory chip) used to store configuration information. See EEPROM.

Parity Checking	A way to verify the accuracy of data transmitted over the SCSI bus. The parity bit in the transfer is used to make the sum of all the 1 bits either odd or even (for odd or even parity). If the sum is not correct, the information may be retransmitted or an error message may appear.
Passive Termination	The electrical connection required at each end of the SCSI bus, composed of a set of resistors. It improves the integrity of bus signals.
PCI	Peripheral Component Interconnect. A local bus specification that allows connection of peripherals directly to computer memory. It bypasses the slower ISA and EISA buses.

Peripheral Devices	A piece of hardware (such as a video monitor, disk drive, printer, or CD-ROM) used with a computer and under the computer's control. SCSI peripherals are controlled through a SCSI host adapter.
Pin-1 Orientation	The alignment of pin 1 on a SCSI cable connector and the pin-1 position on the SCSI connector into which it is inserted. External SCSI cables are always keyed to insure proper alignment, but internal SCSI ribbon cables sometimes are not keyed.
PIO	Programmed Input/Output. A way the CPU can transfer data to and from memory using the computer's I/O ports. PIO is usually faster than DMA, but requires CPU time.

SCSI-2	The current SCSI specification which adds features to the original SCSI-1 standard.
SCSI-3	The SCSI specification which adds features to the SCSI-2 standard.

SCSI Bus	A host adapter and one or more SCSI peripherals connected by cables in a linear chain configuration. The host adapter may exist anywhere on the chain, allowing connection of both internal and external SCSI devices. A system may have more than one SCSI bus by using multiple host adapters.
SCSI Device	Any device that conforms to the SCSI standard and is attached to the SCSI bus by a SCSI cable. This includes SCSI host adapters and SCSI peripherals.
SCSI ID	A way to uniquely identify each SCSI device on the SCSI bus. Each SCSI bus has eight available SCSI IDs numbered 0 through 7 (or 0 through 15 for Wide SCSI). The host adapter usually gets the highest ID, (7 or 15) giving it priority to control the bus.
