* This is advanced information and specifications are subject to change without notice.

DESCRIPTION

The TC514400AP/AJ/ASJ/AZ is the new generation dynamic RAM organized 1,048,576 words by 4 bits. The TC514400AP/AJ/ASJ/AZ utilizes TOSHIBA's CMOS Silicon gate process technology as well as advanced circuit techniques to provide wide operating margins, both internally and to the system user. Multiplexed address inputs permit the TC514400AP/AJ/ASJ/AZ to be packaged in a standard 20 pin plastic DIP, 26/20 pin plastic SOJ (300/350mil) and 20 pin plastic ZIP. The package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented features include single power supply of 5V±10% tolerance, direct interfacing capability with high performance logic families such as Schottky TTL.

NOTES:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.
2. All voltages are referenced to V_{SS}.
3. I_{CC1}, I_{CC3}, I_{CC4}, I_{CC6} depend on cycle rate.
4. I_{CC1}, I_{CC4} depend on output loading. Specified values are obtained with the output open.
5. Column address can be changed once or less while $\overline{RAS}=V_{IL}$ and $\overline{CAS}=V_{IH}$.
6. An initial pause of 200μs is required after power-up followed by 8 $\overline{RAS}$ only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{CAS}$ before $\overline{RAS}$ refresh cycles instead of 8 $\overline{RAS}$ only refresh cycles are required.
7. AC measurements assume $t_T=5ns$.
8. V_{IH} (min.) and V_{IL} (max.) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL}.
9. Measured with a load equivalent to 2 TTL loads and 100pF.
10. t_{OFF} (max.) and t_{OEZ} (max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
11. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
12. These parameters are referenced to $\overline{CAS}$ leading edge in early write cycles and to $\overline{WRITE}$ leading edge in Read-Modify-Write cycles.
13. t_{WCS}, t_{RWD}, t_{CWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geqq t_{WCS}$ (min.), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) through the entire cycle; If $t_{RWD} \geqq t_{RWD}$ (min.), $t_{CWD} \geqq t_{CWD}$ (min.), $t_{AWD} \geqq t_{AWD}$ (min.) and $t_{CPWD} \geqq t_{CPWD}$ (min.) (Fast Page Mode), the cycle is a Read-Modify-Write cycle and the data out will contain data read from the selected cell: If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
14. Operation within the t_{RCD} (max.) limit insures that t_{RAC} (max.) can be met. t_{RCD} (max.) is specified as a reference point only: If t_{RCD} is greater than the specified t_{RCD} (max.) limit, then access time is controlled by t_{CAC}.
15. Operation within the t_{RAD} (max.) limit insures that t_{RAC} (max.) can be met. t_{RAD} (max.) is specified as a reference point only: If t_{RAD} is greater than the specified t_{RAD} (max.) limit, then access time is controlled by t_{AA}.

TEST MODE

The TC514400AP/AJ/ASJ/AZ is the RAM organized 1,048,576 words by 4 bits, it is internally organized 524,288 words by 8 bits. In "Test Mode", data are written into 8 sectors in parallel and retrieved the same way. A0c is not used. If, upon reading, two bits on one I/O pin are equal (all "1"s or "0"s), the I/O pin indicates a "1".

If they were not equal, the I/O pin would indicate a "0". Fig.1 shows the block diagram of TC514400AP/AJ/ASJ/AZ. In "Test Mode", the 1M×4 DRAM can be tested as if it were a 512K×4 DRAM.

"$\overline{\text{WRITE}}$, $\overline{\text{CAS}}$ Before $\overline{\text{RAS}}$ Refresh Cycle puts the device into "Test Mode". And "$\overline{\text{CAS}}$ Before $\overline{\text{RAS}}$ Refresh Cycle" or "$\overline{\text{RAS}}$ Only Refresh Cycle" puts it back into "Normal Mode". In the Test Mode, "$\overline{\text{WRITE}}$, $\overline{\text{CAS}}$ Before $\overline{\text{RAS}}$ Refresh Cycle" Performs the refresh operation with the internal refresh address counter. The "Test Mode" function reducss test times (1/2 in case of N test pattern).
