

1.0 INTRODUCTION

1.1 DESCRIPTION

The FE3031 is an IBM* AT data buffer and parity generator/checker in a 100-pin PLCC package that contains all of the data buffers necessary to implement an AT compatible computer. The FE3031 functions as a peripheral data bus buffer, memory data bus buffer, a parity/generator/checker, and PC/AT data bus buffer.

This document describes the pinouts, signals, timing and electrical specifications of the FE3031 AT Data Buffer IC. The FE3031 is part of the FE3600B AT Core Logic chip set for 16 MHz 80286 based AT computers.

1.2 FEATURES

- 100 Pin PLCC
- PC AT* Data Bus Buffers
- Peripheral Data Bus Buffer
- Memory Data Bus Buffers
- Parity Generator/Checker
- 1.25 Micron CMOS Technology

2.0 SIGNAL DESCRIPTIONS

PIN#	SIGNAL	TYPE	DESCRIPTION
1-4 6-9 11-14 16-19	D(0:15)	I/O	80286 Local Data Bus
5,15 26,36 60,65 74,83 94	V _{SS}		Ground
10,21 31,41 70,78 89,99	V _{DD}		+5V V _{DD}
20	POLO	O	Low byte parity bit to the DRAMs
22-25 27-30 32-35 37-40	DATA (0:15)	I/O	PC/AT Data Bus
42	DTR	I	Data direction for DATA buffers
43	DEN ₀	I	Low byte data enable to DATA buffers
44	DEN ₁	I	High byte data enable to DATA buffers
45	ADR ₀	I	Address bit 0 for MDATA buffers and byte swap
46	SCYCLE	I	Latch low byte during byte swap read
47	SDEN	I	Byte swap data buffer enable
48	SDTR	I	Byte swap data direction to swap buffer
49	ACK	I	DMA Acknowledge signal to the PC/AT bus
50	SELDATA	I	EDATA bus enable
51	INTA	I	Interrupt acknowledge
52	ABHE	I	High byte enable for MDATA bus
53	BUFDIS	I	Disable Buffers when low
54	DLE	I	Latch MDATA bus during a read
55	PLO	I	Low byte parity bit from DRAMs
56	PHI	I	High byte parity bit from DRAMs
57	ONBRD16	I	ONBRD indicates a local

TABLE 2-1. FE3031 SIGNAL DESCRIPTIONS

PIN	SIGNAL	TYPE	DESCRIPTION
58	LOWMEG	I	LOWMEG indicates access of low MB of memory
59	MASTER	I	Master on PC bus has control of the bus
61-64 66-69	EDATA (0:7)	I/O	Peripheral Data Bus for FE3001, FE3010B, RTC and Keyboard controller
71	SMEMR	O	Low 1 MB Memory Read to PC bus
72	SMEMW	O	Low 1 MB Memory Write to PC bus
73	MEMR	I/O	Memory read to/from AT bus
75	MEMW	I/O	Memory read to/from AT bus
76	YMEMR	I/O	Memory read to/from FE3001
77	YMEMW	I/O	Memory write to/from FE3001
79	PERROR	O	RAM parity error
80-82 84-88 90-93 95-98	MDATA (0:15)	I/O	Memory Data bus
100	POHI	O	High byte parity bit to the DRAMs

6.0 PC/AT DATA BUS CYCLES

This description of the data bus cycles of the FE3600B PC AT expansion bus includes CPU, DMA, and MASTER cycles. The data portion of the PC AT expansion bus is a 16-bit wide bus divided into two bytes. In general, the low byte (DATA[0:7]) is accessed during cycles in which the address is even. The high byte (DATA[8:15]) is accessed when the address is odd. During 16-bit operations, both low and high bytes are accessed. There are several combinations of byte wide, word wide, even and odd addressing. Each of these combinations present a unique pattern of bus buffer enables and directions. These data buffer control states are described in this document.

NOTES:

- * Eight bit devices on the PC AT bus are always on the low byte (DATA[0:7]) of the expansion bus regardless of

address. Sixteen bit devices use ADR0 and EBHE to distinguish between high and low byte transfers.

- * In previous designs, the data buffers on the PC AT were inactive during DMA. This was due to the on-board DRAM being on the system bus. Now that the DRAM is on the 286 local bus the data buffers must be enabled and directed during DMA operations.
- * A block diagram of the data bus hardware on the PC AT board is shown in Figure 5-1. It represents the equivalent 74LSXXX circuitry for the data buffers contained on the board. Signals used in this document are discussed in Table 6-1.

TABLE 6-1. SIGNAL DEFINITIONS

7.0 CPU CYCLES

The following cycles represent data cycles under CPU control for all devices excluding the on board DRAM and the 80287 Math Coprocessor. Since the 80287 and on-board DRAM are on the local bus, the data bus drivers for the expansion bus will be disabled. This is accomplished by setting DEN0, DEN1 and SDEN = 1 when ONBRD + /MNIO = 0 or NPCS = 0. Note that on-board I/O is indicated by ONBRD + MNIO = 0. On-board I/O devices are on the system bus.

For all CPU cycles $\overline{\text{HLDA}}=0$ and $\text{INTA}^- =1$. In the following tables, CS16 indicates that there is a 16-bit device on the expansion bus. The boolean equation for CS16 is:

$$\text{CS16} = \overline{\text{PROMCS}} * (\text{IOCS16} + \text{MNIO}) * (\text{MEMCS16} + \overline{\text{MNIO}})$$

The following cycles are described in this section.

- 7.1 16-bit transfer, read from 16-bit device
- 7.2 16-bit transfer, write to 16-bit device
- 7.3 16-bit transfer, read from 8-bit device
- 7.4 16-bit transfer, write to 8-bit device
- 7.5 8-bit sfer, low byte read from 8 or 16-bit device
- 7.6 8-bit transfer, low byte write to 8 or 16-bit device
- 7.7 8-bit transfer, high byte read from 8-bit device
- 7.8 8-bit transfer, high byte write to 8-bit device
- 7.9 8-bit transfer, high byte read from 16-bit device
- 7.10 8-bit transfer, high byte write to 16-bit device

8.0 DMA CYCLES

The following cycles represent data cycles under DMA control for all devices. DMA may be for on board DRAM ($\overline{\text{ONBRD}} = 0$) or system memory ($\overline{\text{ONBRD}} = 1$). Note that $\overline{\text{ONBRD}}$ decode for on-board I/O will be disabled during DMA.

The following DMA cycles are described in this section.

☐ For on board DRAM ($\overline{\text{ONBRD}} = 0$)

- 8.1 8-bit DMA from even memory address to 8-bit I/O device.
- 8.2 8-bit DMA to even memory address from 8-bit I/O device.
- 8.3 8-bit DMA from odd memory address to 8-bit I/O device.

- 8.4 8-bit DMA to odd memory address from 8-bit I/O device.
- 8.5 16-bit DMA from memory to 16-bit I/O.
- 8.6 16-bit DMA to memory from 16-bit I/O.

☐ For system memory ($\overline{\text{ONBRD}} = 1$)

- 8.7 8-bit DMA from 16-bit memory, odd address to 8-bit I/O device.
- 8.8 8-bit DMA to 16-bit memory, odd address from 8-bit I/O device.

☐ For all other DMA cycles the data buffers are disabled.

8.9 All other DMA cycles.

For all DMA cycles $\text{HLDA}=1$, $\text{HLDA1}=1$ and $\text{MASTER}=1$.

9.0 BUS MASTER CYCLES

The following cycles represent data cycles under the control of a bus master other than the 80286 or DMA controller. This condition is indicated by hold acknowledge active (HLDA=1) and bus master asserted (MASTER = 0). It is assumed that the bus master is always a 16-bit device. On-board DRAM and on-board I/O are distinguished by the memory or I/O read/write commands.

☐ For on-board DRAM

- 9.1 8-bit transfer low byte read from memory
- 9.2 8-bit transfer low byte write to memory
- 9.3 8-bit transfer high byte read from memory
- 9.4 8-bit transfer high byte write to memory
- 9.5 16-bit transfer read from memory
- 9.6 16-bit transfer write to memory

☐ For system memory and I/O

- 9.7 8-bit transfer high byte read from 8-bit system memory or I/O
- 9.8 8-bit transfer high byte write to 8-bit system memory or I/O
