3.3 V 64M × 64/72-Bit SDRAM Modules
168-pin Unbuffered DIMM Modules

- 168-pin unbuffered 8 Byte Dual-In-Line SDRAM Modules for PC main memory applications
- PC100 and PC133 versions
- Two bank 64M × 64 and 64M × 72 organization
- Optimized for byte-write non-parity or ECC applications
- Fully PC board layout compatible to INTEL's Rev. 1.0 module specification
- JEDEC standard Synchronous DRAMs (SDRAM
- Programmed Latencies:

Product Speed		CL	t_{RCD}	t_{RP}
-7.5	PC133	3	3	3
-8	PC100	2	2	2
-8A	PC100	3	2	2
-8B	PC100	3	2	3

- Single + 3.3 V (± 0.3 V) power supply
- Programmable $\overline{\text{CAS}}$ Latency, Burst Length, and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- Decoupling capacitors mounted on substrate
- All inputs and outputs are LVTTL compatible
- Serial Presence Detect with E^2PROM
- Uses Infineon 256 Mbit SDRAM components in 32M × 8 organization and TSOPII-54 packages
- Gold contact pad, card size: 133.35 mm × 31.75 mm × 4.00 mm

- SDRAM Performance:

The HYS 64V64220GU and HYS 72V64220GU are industry standard 168-pin 8-byte Dual in-line Memory Modules (DIMMs) which are organized as 64M × 64 and 64M × 72 in two banks high speed memory arrays designed with 256M Synchronous DRAMs (SDRAMs) for non-parity and ECC applications. The DIMMs use 7-5 speed sorted 256 Mbit Synchronous DRAMs (SDRAMs) to meet the PC133-333 requirements and -8, -8A and -8B components for the standard PC100 applications. Decoupling capacitors are mounted on the PC board. The PC board design is according to INTEL's PC100 module specification. The DIMMs have a serial presence detect, implemented with a serial E^2PROM using the 2-pin I^2C protocol. The first 128 bytes are utilized by the DIMM manufacturer and the second 128 bytes are available to the end user. All Infineon 168-pin DIMMs provide a high performance, flexible 8-byte interface in a 133.35 mm long footprint, with 1.25" (31.75 mm) height.

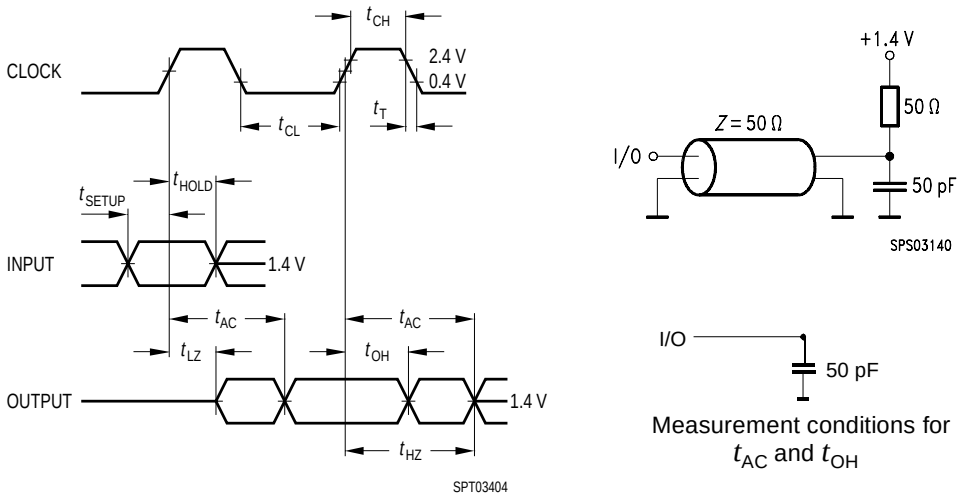
Notes

1. These parameters depend on the cycle rate. These values are measured at 133 MHz for -7.5 modules and at 100 Mhz for -8 modules. Input signals are changed once during t_{CK}, except for I_{CC6} and for standby currents when t_{CK} = infinity. All values are shown per memory component.
2. These parameters are measured with continuous data stream during read access and all DQ toggling. CL = 3 and BL = 4 assumed and the V_{DDQ} current is excluded.
3. All AC characteristics are shown on SDRAM component level.
   An initial pause of 100 µs is required after power-up, then a Precharge All Banks command must be given followed by eight Auto-Refresh (CBR) cycles before the Mode Register Set Operation can begin.
4. AC timing tests have V_{IL} = 0.4 V and V_{IH} = 2.4 V with the timing referenced to the 1.4 V crossover point. The transition time is measured between V_{IH} and V_{IL}. All AC measurements assume t_T = 1 ns with the AC output load circuit show. Specified t_{AC} and t_{OH} parameters are measured with a 50 pF only, without any resistive termination and with a input signal of 1 V/ns edge rate between 0.8 V and 2.0 V.
5. If clock rising time is longer than 1 ns, a time (t_T/2 – 0.5) ns must be added to this parameter.
6. Rated at 1.4 V

7. If t_T is longer than 1 ns, a time (t_T – 1) ns has to be added to this parameter.
8. Anytime the Refresh Period has been exceeded, a minimum of two Auto-Refresh (CBR) commands must be given to “wake-up” the device.
9. Timing is asynchronous. If setup time is not met by rising edge of the clock then the CKE signal is assumed latched on the next cycle.
10. Self-Refresh Exit is a synchronous operation and begins on the second positive clock edge after CKE returns high. Self-Refresh Exit is not complete until a time period equal to t_{RC} is satisfied after the Self Refresh Exit command is registered.
11. This is referenced to the time at which the output achieves the open circuit condition, not to output voltage levels.



A serial presence detect storage device - E^2PROM - is assembled onto the module. Information about the module configuration, speed, etc. is written into the E^2PROM device during module production using a serial presence detect protocol (I^2C synchronous 2-wire bus).

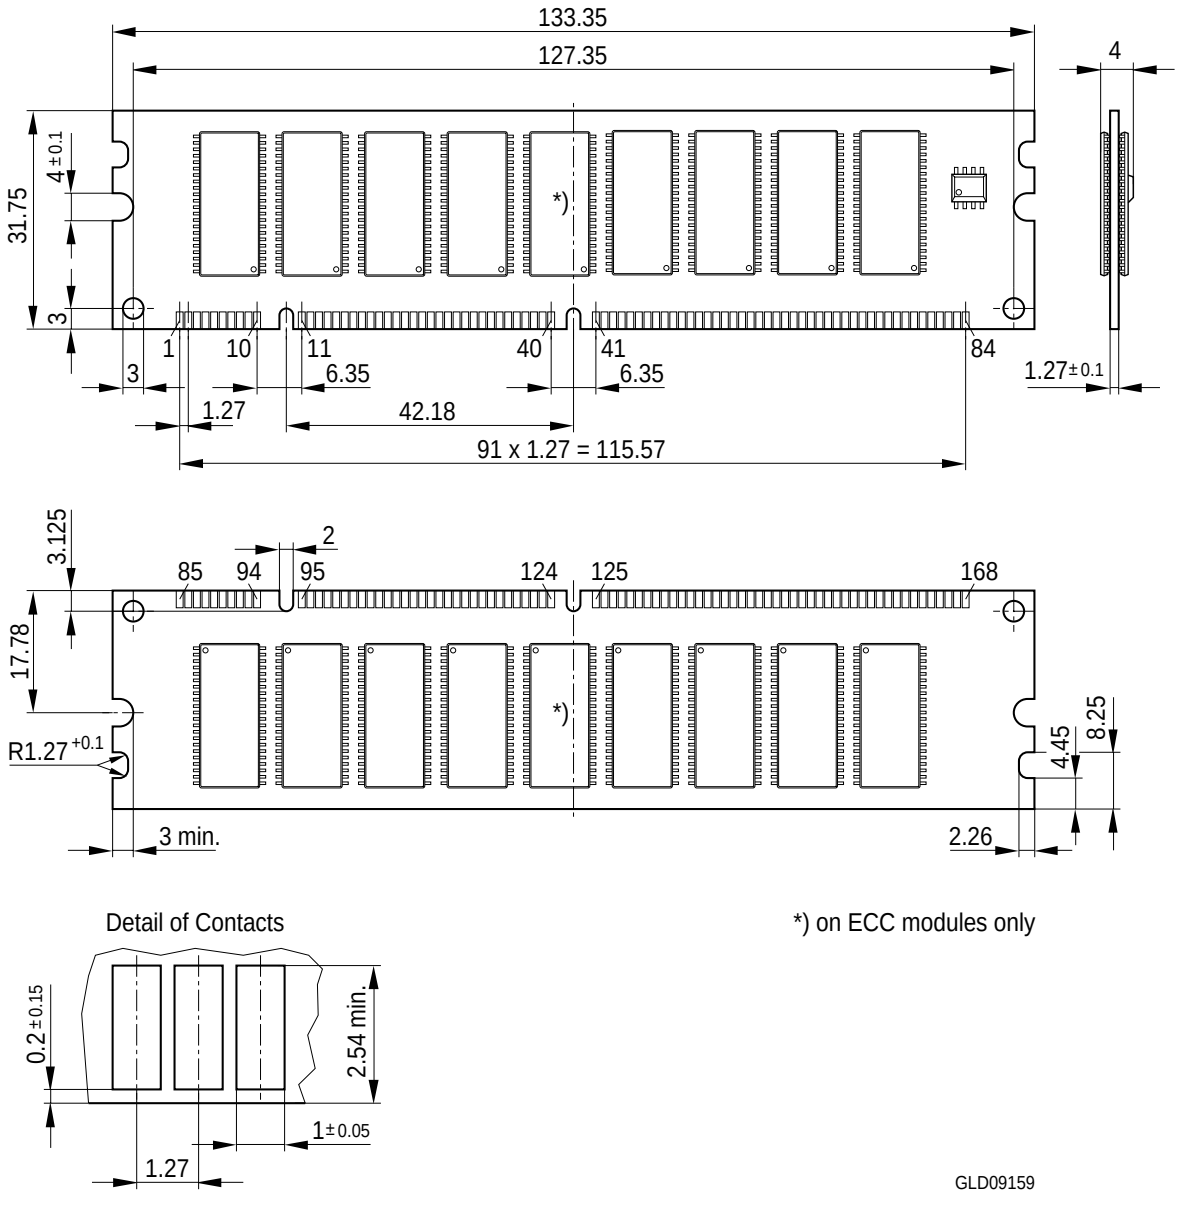
Package Outlines

L-DIM-168-30
SDRAM DIMM Module Package
HYS 64/72V64220GU



Change List:

14.1.1999	Input capacitances adjusted
18.4.1999	-8A speed sort added Infineon logo added SPD codes updated according to new 256M speedsorts
12.5.99	Some ICC current values changed due to new inputs
3.8.99	PC133 merged into this datasheet
23.8.99	Byte 126 changed to 64h for PC133 modules
6.9.99	Template from R&L
20.10.99	CL=2 max. frequency changed to 83 Mhz for -7.5 modules
2.12.99	Some timing parameters adjusted according to INTELs PC133 specification
