

DESCRIPTION

The HY628100 is a high-speed, low power and 131,072 x 8-bits CMOS static RAM fabricated using Hyundai's high performance twin tub CMOS process technology. This high reliability process coupled with innovative circuit design techniques, yields maximum access time of 70ns. The HY628100 has a data retention mode that guarantees data to remain valid at a minimum power supply voltage of 2.0 volt. Using CMOS technology, supply voltages from 2.0 to 5.5 volt have little effect on supply current in data retention mode. Reducing the supply voltage to minimize current drain is unnecessary with the HY628100 Series.

FEATURES

- High speed - 70/85/100/120ns (max.)
- Low power consumption
 - Operating : 150 mW (typ.)
 - Standby (CMOS) : 5 μ W (typ.)
- Single 5V $\pm$ 10% power supply
- Battery backup (L/LL-part)
 - 2.0V (min.) data retention
- Fully static operation
 - No clock or refresh required
- TTL compatible inputs and outputs
- Tri-state output
- Standard pin configuration
 - 32 pin 600 mil PDIP
 - 32 pin 525 mil SOP
 - 32 pin 8x20 mm TSOP-I

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

SYMBOL	PARAMETER	RATING	UNIT
V _{CC} , V _{IN} , V _{OUT}	Power Supply, Input/Output Voltage	- 0.5 to 7.0	V
T _A	Operating Temperature	0 to 70	°C
T _{BIAS}	Temperature under Bias	- 10 to 125	°C
T _{STG}	Storage Temperature	- 65 to 150	°C
P _D	Power Dissipation	1.0	W
I _{OUT}	Data Output Current	50	mA
TSOLDER	Lead Soldering Temperature & Time	260•10	°C •sec

Note :

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.

TIMING DIAGRAM

READ CYCLE 1

Note (READ CYCLE):

1. t_{CHZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition, t_{CHZ} max. is less than t_{CLZ} min. both for a given device and from device to device.
3. $\overline{WE}$ is high for read cycle.

READ CYCLE 2

Note(READ CYCLE):

1. $\overline{WE}$ is high for read cycle.
2. Device is continuously selected $\overline{CS1} = V_{IL}$, $CS2 = V_{IH}$.
3. $OE = V_{IL}$.

WRITE CYCLE 1 (WE Controlled)

WRITE CYCLE 2 (CS1 Controlled)

WRITE CYCLE 3 (CS2 Controlled)

Note (WRITE CYCLE):

1. A write occurs during the overlap of a low $\overline{CS1}$ and high CS2 and a low $\overline{WE}$. A write begins at the latest transition among $\overline{CS1}$ going low, CS2 going high and $\overline{WE}$ going low: A write ends at the earliest transition among $\overline{CS1}$ going high, CS2 going low and $\overline{WE}$ going high. twp is measured from the beginning of write to the end of write.
2. tcw is measured from the later of $\overline{CS1}$ going low or CS2 going high to end of write.
3. tAS is measured from the address valid to the beginning of write.
4. tWR1 is measured from the end of write to the address change. tWR1 applied in case a write ends as $\overline{CS1}$, or $\overline{WE}$ going high, tWR2 applied in case a write ends at CS2 going low.
5. If $\overline{OE}$, CS2 and $\overline{WE}$ are in the read mode during this period, the I/O pins are in the output low-Z state, inputs of opposite phase of the output must not be applied because bus contention can occur.
6. if $\overline{CS1}$ goes low simultaneously with $\overline{WE}$ going low or after $\overline{WE}$ going low, the outputs remain in high impedance state.
7. DOUT is the read data of the new address.
8. When $\overline{CS1}$ is low and CS2 is high, I/O pins are in the output state. The input signals in the opposite phase leading to the outputs should not be applied.
