t_{RAC}	$\overline{RAS}$ Access Time	50ns	60ns
t_{CAC}	$\overline{CAS}$ Access Time	13ns	15ns
t_{AA}	Access Time From Address	25ns	30ns
t_{RC}	Cycle Time	90ns	110ns
t_{PC}	Fast Page Mode Cycle Time	35ns	40ns
- All inputs and outputs are LVTTTL (3.3V) compatible
- Single 3.3V $\pm$ 0.3V Power Supply

- Au contacts
- Optimized for byte-write non-parity applications
- System Performance Benefits:
 - Reduced noise (18 V_{SS} /18 V_{CC} pins)
 - Byte write, byte read accesses
 - Serial PDs
- Fast Page Mode, Read-Modify-Write Cycles
- Refresh Modes: $\overline{RAS}$ -Only, CBR Hidden Refresh and Self Refresh
- 4096 refresh cycles distributed across 256ms
- 12/10 addressing (Row/Column)
- Card size: 2.66" x 1.0" x 0.149"
- DRAMS in TSOP Package

Description

IBM11T4640MP is an industry standard 144-pin 8-byte Small Outline Dual In-line Memory Module (SO DIMM) which is organized as a 4Mx64 high speed memory array designed for use in non-parity applications. The SO DIMM uses 4 4Mx16 DRAMS in TSOP packages.

This card uses *serial presence detects* implemented via a serial EEPROM using the two pin I^2C Protocol. This communication protocol uses CLOCK (SCL) and DATA I/O (SDA) lines to synchronously clock

data between the master (ex: The System Microprocessor) and the slave EEPROM device. The device address for the EEPROM is set to zero at the card. The first 128 bytes are utilized by the SO DIMM manufacturer and the second 128 bytes are available to the end user.

All IBM 144-pin SO DIMMs provide a high performance, flexible 8-byte interface in a 2.66" long space-saving footprint. Related products are the 1Mx64, 2Mx64 and the x72 (ECC) SO DIMMs.

- I_{CC1}, I_{CC3}, I_{CC4} and I_{CC6} depend on cycle rate.
- I_{CC1} and I_{CC4} depend on output loading. Specified values are obtained with the output open.
- Address can be changed once or less while RAS = V_{IL}. In the case of I_{CC4}, it can be changed once or less when CAS = V_{IH}.

AC Characteristics ($T_A = 0$ to $+70^\circ\text{C}$, $V_{CC} = 3.3\text{V} \pm 0.3\text{V}$)

- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} .
- An initial pause of $100\mu\text{s}$ is required after power-up followed by 8 $\overline{\text{RAS}}$ only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles instead of 8 $\overline{\text{RAS}}$ only refresh cycles is required..
- AC measurements assume $t_T = 2\text{ns}$.
- Valid column addresses are A0 through A8.

- Operation within the $t_{RCD}(\text{max})$ limit ensures that $t_{RAC}(\text{max})$ can be met. The $t_{RCD}(\text{max})$ is specified as a reference point only: If t_{RCD} is greater than the specified $t_{RCD}(\text{max})$ limit, then access time is controlled by t_{CAC} .
- Operation within the $t_{RAD}(\text{max})$ limit ensures that $t_{RAC}(\text{max})$ can be met. The $t_{RAD}(\text{max})$ is specified as a reference point only: If t_{RAD} is greater than the specified $t_{RAD}(\text{max})$ limit, then access time is controlled by t_{AA} .
- Either t_{CDD} or t_{OED} must be satisfied.
- Either t_{DZC} or t_{DZO} must be satisfied.

1. t_{WCS} , t_{RWD} , t_{CWD} , t_{AWD} , and t_{CPW} are not restrictive parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}(\text{min.})$, the entire cycle is an early write cycle and the data pin will remain open circuit (high impedance) through the entire cycle; If $t_{RWD} \geq t_{RWD}(\text{min.})$, $t_{CWD} \geq t_{CWD}(\text{min.})$, $t_{AWD} \geq t_{AWD}(\text{min.})$ and $t_{CPW} \geq t_{CPW}(\text{min.})$ (Fast Page Mode), the cycle is a Read-Modify-Write cycle and the data will contain read from the selected cell: If neither of the above sets of conditions are met, the condition of the data (at access time) is indeterminate.
2. These parameters are referenced to $\overline{LCAS}$ or $\overline{UCAS}$ leading edge in early write cycles and to $\overline{WE}$ leading edge in Read-Modify-Write cycles.

1. Operation within the $t_{RCD}(\max.)$ limit ensures that $t_{RAC}(\max.)$ can be met. $t_{RCD}(\max.)$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\max.)$ limit, then access time is controlled by t_{CAC} .
2. Operation within the $t_{RAD}(\max.)$ limit ensures that $t_{RAC}(\max.)$ can be met. $t_{RAD}(\max.)$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\max.)$ limit, then access time is controlled by t_{AA} .
3. Either t_{CDD} or t_{OED} must be satisfied.
4. Measured with the specified current load and 100pF.
5. Either t_{RCH} or t_{RRH} must be satisfied.
6. $t_{OFF}(\max)$ and $t_{OEZ}(\max)$ define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.

t_{CHS}	CAS Hold Time During Self Refresh Cycle)	50	—	50	—	ns	1
1. When using Self Refresh mode, the following refresh operations must be performed to ensure proper DRAM operation: If row addresses are being refreshed in an EVENLY DISTRIBUTED manner over the refresh interval using CBR refresh cycles, then only one CBR cycle must be performed immediately after exit from Self Refresh. If row addresses are being refreshed in any other manner (ROR - Distributed/Burst; or CBR-Burst) over the refresh interval, then a full set of row refreshes must be performed immediately before entry to and immediately after exit from Self Refresh.

t_{DH}	Data Out Hold Time	300		ns	
t_{WR}	Write Cycle Time		10	ms	1

1. The write cycle time(t_{WR}) is the time from a valid stop condition of a write sequence to the end of the internal erase/program cycle. During the write cycle, the bus interface circuits are disabled, SDA is allowed to remain high per the bus-level pull-up resistor, and the device does not respond to its slave address.

Write Cycle (Late Write)

NOTE 1: Implementing $\overline{\text{WE}}$ at $\overline{\text{RAS}}$ time During a Read or Write Cycle is optional. Doing so will facilitate compatibility with future EDO DRAMs.

NOTE: Address and OE are "H" or "L"

Once t_{RASS} (min) is provided and RAS remains low, the DRAM will be in Self Refresh, commonly known as "Sleep Mode."

Presence Detect (EEPROM) Bus Timing

Presence Detect Operation

Clock and Data Conventions: Data states on the SDA line can change only during SCL low. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (Figure 1 & Figure 2).

Start Condition: All commands are preceded by the start condition, which is a HIGH to LOW transition of SDA when SCL is high. The serial PD device continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

Stop Condition: All communications are terminated by a stop condition, which is a LOW to HIGH transition of SDA when SCL is HIGH. The stop condition is also used to place the serial PD device into standby power mode.

Acknowledge: Acknowledge is a software convention used to indicate successful data transfers. The transmitting device, either master or slave, will release the bus after transmitting eight bits. During the ninth clock cycle the receiver will pull the SDA line LOW to acknowledge that it received the eight bits of data (Figure 3).

The PD device will always respond with an acknowledge after recognition of a start condition and its slave address. If both the device and a write operation have been selected, The PD device, will respond with an acknowledge after the receipt of each subsequent eight bit word. In the read mode the PD device will transmit eight bits of data, release the SDA line and monitor the line for an acknowledge. If an acknowledge is detected and no

stop condition is generated by the master, the slave will continue to transmit data. If an acknowledge is not detected, the slave will terminate further data transmissions and await the stop condition to return to standby power mode.
