

High Performance
32K×32
CMOS SRAM

AS7C33232
AS7C33232F

32K×32 Synchronous burst SRAM

Features

- Organization: 32,768 words × 32 bits
- Fully synchronous pipelined operation
- Flow-through option (F version)
- Fast clocking speed: 100/75/66/60 MHz
- Fast clock to data access: 5.5/7/8.5/10 ns
- Self-timed write cycle
- On-chip address, control, and data registers
- Byte write enable & global write enable control

- Asynchronous output enable control
- ADSP, ADSC, ADV, MODE burst control pins
- Pentium™ or PowerPC™ count sequence
- Transparent logic support for 1 or 2 CPUs
- Single 3.3 ± 0.3V power supply
- 5V safe inputs
- ESD protection > 2000 volts
- Latch-up current > 200 mA

Functional description

The AS7C33232 is a high performance CMOS 1 Mbit synchronous Static Random Access Memory (SRAM) organized as 32,768 words $\times$ 32 bits and incorporates a 2-bit burst counter and output register. It is designed for high performance 3.3V Pentium™ and PowerPC™ cache applications.

Fast cycle times of 10/13/15/17 ns with output enable access times (t_{OE}) of 4/5/6/7 ns are ideal for 100, 75, 66, and 60 MHz bus frequencies. Three chip enable inputs permit easy memory expansion. Burst operation is initiated in one of two ways: the controller address strobe ($\overline{ADSC}$), or the processor address strobe ($\overline{ADSP}$). The burst advance pin ($\overline{ADV}$) allows subsequent internally generated burst addresses.

Read cycles are initiated with $\overline{ADSP}$ (regardless of $\overline{WE}$ and $\overline{ADSC}$) using the new external address clocked into the on-chip address register when $\overline{ADSP}$ is sampled LOW, the chip enables are sampled active, and the output buffer is enabled with $\overline{OE}$. In a read operation the data accessed by the current address, registered in the address registers by the positive edge of CLK, are carried to the data-out registers and driven on the output pins on the next positive edge of CLK. $\overline{ADV}$ is ignored on the clock edge that samples $\overline{ADSP}$ asserted, but is sampled on all subsequent clock edges. Address is incremented internally for the next access of the burst when $\overline{WE}$ is sampled HIGH, $\overline{ADV}$ is sampled LOW, and both address strobes are HIGH. Burst operation is selectable with the MODE input. With MODE unconnected or driven HIGH, burst operations use a Pentium/486 count sequence. With MODE driven LOW the device uses a linear count sequence, suitable for PowerPC and many other applications (refer to the Burst sequence table on page 2).

Write cycles are performed by disabling the output buffers with $\overline{OE}$ and asserting $\overline{WE}$. A global write enable $\overline{GWE}$ writes all 32 bits regardless of the state of individual $\overline{WE0}$ – $\overline{WE3}$ inputs. Alternately, when $\overline{GWE}$ is HIGH, one or more bytes may be written by asserting $\overline{BWE}$ and the appropriate individual byte $\overline{WE}$ signal(s). $\overline{WE0}$ controls I/O0-I/O7; $\overline{WE1}$ controls I/O8-I/O15; $\overline{WE2}$ controls I/O16-I/O23; and $\overline{WE3}$ controls I/O24-I/O31.

$\overline{WE}$ is ignored on the clock edge that samples $\overline{ADSP}$ LOW, but is sampled on all subsequent clock edges. Output buffers are disabled when $\overline{WE}$ is sampled LOW (regardless of $\overline{OE}$). Data is clocked into the data input register when $\overline{WE}$ is sampled LOW. Address is incremented internally to the next burst of address if $\overline{WE}$ and $\overline{ADV}$ are sampled LOW.

Read or write cycles may also be initiated with $\overline{ADSC}$ instead of $\overline{ADSP}$. The differences between cycles initiated with $\overline{ADSC}$ and $\overline{ADSP}$ follow.

- $\overline{ADSP}$ must be sampled HIGH when $\overline{ADSC}$ is sampled LOW to initiate a cycle with $\overline{ADSC}$.
- $\overline{WE}$ signals are sampled on the clock edge that samples $\overline{ADSC}$ LOW (and $\overline{ADSP}$ HIGH).
- Master chip select $\overline{CE1}$ blocks $\overline{ADSP}$, but not $\overline{ADSC}$.

The AS7C33232F incorporates a flow-through feature which makes the output registers transparent. Tying the $\overline{FT}$ pin low enables flow-through mode and disables pipelined operation. The ZZ sleep mode in the AS7C33232F reduces power consumption in standby mode. The AS7C33232F is recommended for all new designs. The AS7C33232 operates from a single 3.3V $\pm$ 0.3V supply. The AS7C33232 is packaged in a 100-pin 14 $\times$ 20 mm PQFP or TQFP package.

Write enable truth table (per byte)

$\overline{GWE}$	$\overline{BWE}$	$\overline{WEn}$	WRITE _n
L	X	X	T
X	L	L	T
H	H	X	F
H	L	H	F [†]

Key: X = Don't Care, L = LOW, H = HIGH.

[†] Valid read.

Asynchronous truth table

$\overline{OE}$	I/O [31:0]
L	Read data
H	HIGH-Z

Note: For write cycles that follow read cycles, output buffers must be disabled with $\overline{OE}$ to prevent data bus contention.

Key: L = LOW, H = HIGH.

Burst sequence table

	Mode = HIGH/No Connect Pentium Count Sequence				Mode = LOW Linear Count Sequence			
	00	01	10	11	00	01	10	11
Start address	00	01	10	11	00	01	10	11
Second address	01	00	11	10	01	10	11	00
Third address	10	11	00	01	10	11	00	01
Fourth address	11	10	01	00	11	00	01	10

Note: The burst sequence wraps around to its initial state upon completion.

Signal descriptions

Signal	I/O	Properties	Description
CLK	I	CLOCK	Clock. All inputs except $\overline{OE}$ are synchronous to this clock.
A0–A14	I	SYNC	Address. Sampled when all chip enables are active and $\overline{ADSC}$ or $\overline{ADSP}$ are asserted.
I/O0–I/O31	I/O	SYNC	Data. Driven as output when the chip is enabled and $\overline{OE}$ is active.
$\overline{CE1}$	I	SYNC	Master chip enable. Sampled on clock edges when $\overline{ADSP}$ or $\overline{ADSC}$ is active. When $\overline{CE1}$ is inactive, $\overline{ADSP}$ is blocked. Refer to the SYNCHRONOUS TRUTH TABLE for more information.
$\overline{CE2}$, $\overline{CE3}$	I	SYNC	Synchronous chip enables. Active HIGH and active LOW, respectively. Sampled on clock edges when $\overline{ADSC}$ is active or when $\overline{CE1}$ and $\overline{ADSP}$ are active.
$\overline{ADSP}$	I	SYNC	Address strobe processor. Asserted LOW to load a new bus address or to enter standby mode.
$\overline{ADSC}$	I	SYNC	Address strobe controller. Asserted LOW to load a new address or to enter standby mode.
$\overline{ADV}$	I	SYNC	Advance. Asserted LOW to continue burst read/write.
$\overline{GWE}$	I	SYNC default = HIGH	Global write enable. Asserted LOW to write all 32 bits. When HIGH, $\overline{BWE}$ and $\overline{WE0-WE3}$ control write enable. This signal is internally pulled HIGH.
$\overline{BWE}$	I	SYNC default = LOW	Byte write enable. Asserted LOW with $\overline{GWE}$ = HIGH to enable effect of $\overline{WE0-WE3}$ inputs. This signal is internally pulled LOW.
$\overline{WE0-WE3}$	I	SYNC	Write enables. Used to control write of individual bytes when $\overline{GWE}$ = HIGH and $\overline{BWE}$ = LOW. If any of $\overline{WE0-WE3}$ is active with $\overline{GWE}$ = HIGH and $\overline{BWE}$ = LOW the cycle is a write cycle. If all $\overline{WE0-WE3}$ are inactive the cycle is a read cycle.
$\overline{OE}$	I	ASYNC	Asynchronous output enable. I/O pins are driven when $\overline{OE}$ is active and the chip is synchronously enabled.
MODE	I	STATIC default = HIGH	Count mode. When driven HIGH, count sequence follows Intel XOR convention. When driven LOW, count sequence follows Motorola/linear convention. This signal is internally pulled HIGH. ¹⁸
$\overline{FT}^\dagger$	I	STATIC	Flow-through mode. When low, enables flow-through mode. Connect to V_{CC} if unused or for pipelined operation.
$\overline{ZZ}^\dagger$	I	ASYNC	Sleep. Places device in low power mode; data is retained. Connect to GND if unused. ¹⁹

[†] These controls apply to the 7C33232F only. When using the 7C33232, pin 14 should be tied high and pin 64 should be tied low.

Absolute maximum ratings

Parameter	Symbol	Min	Max	Unit
Power supply voltage relative to GND	V_{CC}	–0.5	+4.6	V
Input voltage relative to GND (input pins)	V_{IN}	–0.5	+6.0	V
Input voltage relative to GND (I/O pins)		–0.5	$V_{CC}+0.5$	V
Power dissipation	P_D	–	1.2	W
DC output current	I_{OUT}	–	30	mA
Storage temperature (plastic)	T_{stg}	–65	+150	°C
Temperature under bias	T_{bias}	–65	+135	°C

NOTE: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect reliability.

Capacitance¹

Parameter	Symbol	Signals	Test Conditions	Max	Unit
Input capacitance	C_{IN}	Address and control pins, MODE, ZZ	$V_{in} = 0V$	5	pF
I/O capacitance	$C_{I/O}$	I/O pins	$V_{in} = V_{out} = 0V$	7	pF

PCB land pattern

This land pattern accommodates both PQFP and TQFP packages.

Notes

- 1 Pad requirement to accommodate two package types is larger than for one package type.
- 2 All dimensioning and tolerancing conform to ANSI Y14.5M-1982. Dimensions in mm.
- 3 Datums A--B and --D-- to be determined from the center two leads.
- 4 Based on the surface mount Design and Land Pattern Standard in IPC-SM-782 rev. A, subsection 11.3, 8/93 for PQFP.

Shaded areas contain preliminary information.

Notes

- This parameter is guaranteed but not tested.
- For test conditions, see AC Test Conditions, Figures A, B, C.
- $\overline{OE}$ state is "don't care" when a byte write enable is sampled LOW.
- This parameter is sampled and not 100% tested.
- Read cycle is defined as byte write enables all HIGH or $\overline{ADSP}$ LOW for required setup and hold times. Write cycle is defined as at least one byte write enable LOW and $\overline{ADSP}$ HIGH for required setup and hold times.
- This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when either $\overline{ADSP}$ or $\overline{ADSC}$ is LOW and chip enabled. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of CLK when chip is enabled. Chip enable must be valid at each rising edge of CLK with either $\overline{ADSP}$ or $\overline{ADSC}$ LOW to remain enabled.
- Typical values measured at 3.3V, 25°C and 20 ns cycle time.
- All voltages referenced to GND.
- Overshoot: $V_{IH} \leq +6.0V$ for $t \leq t_{CYC}/2$
Undershoot: $V_{IL} \geq -2.0V$ for $t \leq t_{CYC}/2$
Power up: $V_{IH} \leq +6.0V$ and $V_{CC} \leq 3.1V$ for $t \leq 200$ ms
- I_{CC} given with no output current. I_{CC} increases with faster cycle times and greater output loading.
- Transitions are measured ± 500 mV from steady state voltage. Output loading specified with $C_L = 5$ pF as in Figure C.
- t_{HZOE} is less than t_{LZOE} and t_{HZA} is less than t_{LZA} at any given temperature and voltage.
- Deselect = device inactive, in powered-down mode. Otherwise device active (not in powered-down mode).
- Mode pin exhibits input leakage current of $\pm 10\mu A$ in linear burst mode and has an internal pull-up.
- At least two clock cycles are required for entry or exit from sleep mode after ZZ assertion. ZZ specifications to comply with Intel documentation.
