DESCRIPTION

The DAC9331-14 is a low cost 14-bit multiplying digital-to-analog converter packaged in a unique 24-pin double DIP. Capable of 2 and 4-quadrant multiplication, the unit is TTL/DTL and CMOS compatible with power consumption less than 30mW. Power supply options include +5V (-1) or +15V (-2). Outstanding features of the DAC9331-14 include:

True 14-Bit Performance — Up to 14-bit resolution and accuracy over the 0 to 70°C operating range.

2 And 4-Quadrant Multiplication — Reference input range to ± 25 volts.

Low Power — CMOS technology provides less than 30mW total power dissipation — a real battery saver.

Reliability Plus — Packaged in a unique enclosure which has undergone extensive environmental testing during its development, the DAC9331-14 is continuously monitored during all assembly and test operations by our quality control organization.

Reliability is enhanced by batch-processed, precision laser-trimmed resistor networks fabricated in our own facility. Similar to monolithic circuits, the networks are processed and functionally trimmed to assure consistent performance. Networks are glass passivated to assure reliability under adverse environmental conditions.

NOTES:

- The switching threshold is typically $V_{DD}/2$ for -1 models and $V_{DD}/6$ for -2 models. The logic input must never exceed $V_{DD}/3$ for -2 models.
- Using internal feedback resistor.
- Using the internal $R_{FEEDBACK}$ with nulled external amplifier in a constant 25°C ambient. (Offset doubles every 10°C).
- Best straight line method of test.
- The DAC9331-14 Series is designed to be used only in those applications where the current output is virtual ground; i.e., the summing junction of an op amp in the inverting mode. The internal feedback resistor ($R_{FEEDBACK}$) must be used to achieve temperature tracking. See APPLICATIONS INFORMATION for recommended circuit configurations.
- The power supply voltage must not exceed +10V for the -1 versions or +15.5V for the -2 versions.

APPLICATIONS INFORMATION

UNIPOLAR OPERATION (2-Quadrant Multiplication)

NOTE: To maintain specified DAC9331 linearity, the external amplifier (A) must be zeroed. Apply an ALL 'ZEROS' digital input and adjust R_{GS} for $V_{OUT} = 0 \pm 1mV$.

BIPOLAR OPERATION (4-Quadrant Multiplication)

NOTE: TO MAINTAIN SPECIFIED LINEARITY, EXTERNAL AMPLIFIERS (A1 AND A2) MUST BE ZEROED. WITH A DIGITAL INPUT OF 10...0
a) SET R_{GS1} FOR $V_{OUT} = 0$
b) SET R_{GS2} FOR $V_{OUT} = 0$
c) SET V_{REF} TO +10V AND ADJUST R_B FOR V_{OUT} TO BE 6 VOLTS.

ANALOG/DIGITAL DIVISION

Via the above configuration, the DAC9331 can be used to divide an analog signal by a digital code (i.e., for digitally controlled gain). The transfer function is given as

$$V_{OUT} = \frac{-V_{IN}}{\frac{Bit\ 1}{2^1} + \frac{Bit\ 2}{2^2} + \frac{Bit\ 3}{2^3} + \dots + \frac{Bit\ 14}{2^{14}}}$$

where the value of each bit is 0 or 1. Division by all "0's" is undefined and causes the op amp to saturate.

CAUTION: ESD (Electro-Static Discharge) sensitive device. Permanent damage may occur when unconnected devices are subjected to high energy electrostatic fields. Unless otherwise noted, the voltage at any digital input should never exceed the supply voltage by more than 0.5 volts or go below -0.5 volts.
