

DESCRIPTION

The HY5117400A is the new generation and fast dynamic RAM organized 4,194,304 x 4-bit. The HY5117400A utilizes Hyundai's CMOS silicon gate process technology as well as advanced circuit techniques to provide wide operating margins to the users. Multiplexed address inputs permit the HY5117400A to be packaged in a standard 24/26 pin plastic SOJ, TSOP-II and Reverse TSOP-II.

The package size provides high system bit densities and is compatible with widely available automated testing and insertion equipments. System oriented feature includes single power supply of $5V \pm 10\%$ tolerance and direct interfacing capability with high performance logic families such as Schottky TTL.

NOTE:

1. An initial pause of 200ms is required after power-up followed by any 8 $\overline{\text{RAS}}$ only or $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle before proper device operation is achieved.
2. If $\overline{\text{RAS}}=\text{Vss}$ during power-up, the HY5117400A could begin an active cycle. These condition results in higher current than necessary which is demanded from the power supply during power-up. It is recommended that $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ track with Vcc during power-up or be held at a valid VIH in order to minimize the power-up current
3. $\text{VIH}(\text{min.})$ and $\text{VIL}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between $\text{VIH}(\text{min.})$ and $\text{VIL}(\text{max.})$, and are assumed to be 5ns for all inputs.
4. Measured at $\text{VOH}=2.4\text{V}$ and $\text{VOL}=0.4\text{V}$ with a load equivalent to 2 TTL loads and 100pF.
5. $\text{tOFF}(\text{max.})$ and tOEZ define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
6. Either tRCH or tRRH must be satisfied for a read cycle.
7. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in Read-Modify-Write cycles.
8. twCS , trWD , tcWD , tAWD and tcpWD are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $\text{twCS} \geq \text{twCS}(\text{min.})$, the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle. if $\text{trWD} \geq \text{trWD}(\text{min.})$, $\text{tcWD} \geq \text{tcWD}(\text{min.})$, $\text{tAWD} \geq \text{tAWD}(\text{min.})$, and $\text{tcpWD} \geq \text{tcpWD}(\text{min.})$, the cycle is a Read-Modify-Write cycle and data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminated.
9. Operation within the $\text{trCD}(\text{max.})$ limit insures that $\text{trAC}(\text{max.})$ can be met. $\text{trCD}(\text{max.})$ is specified as a reference point only. If trCD is greater than the specified $\text{trCD}(\text{max.})$ limit, then access time is controlled by tcAC .
10. Operation within the $\text{trAD}(\text{max.})$ limit insures that $\text{trAC}(\text{max.})$ can be met. $\text{trAD}(\text{max.})$ is specified as a reference point only. If trAD is greater than the specified $\text{trAD}(\text{max.})$ limit, then access time is controlled by tAA .
11. $\text{tREF}(\text{max.})=256\text{ms}$ is applied to L-Parts(HY5117400ALJC, HY5117400ALTC and HY5117400ALRC).
12. A burst of 2048 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycles must be executed within 64ms(256ms for SL-part) after exiting self refresh.
13. These specifications are applied to the test Mode.

CAPACITANCE

TEST MODE

The HY5117400A is a DRAM organized 4,194,304 x 4-bit. It is internally organized 1,048,576 x 16-bit. In Test Mode, data are written into 16 sectors (Each is composed of 512K bits) in parallel and retrieved the same way. Column address A0 is not used. If, upon reading, all 4-bit data from 4 sectors connected to one DQ pin are equal (all "1"s or "0"s), the DQ pin indicates a "1". If they are not equal, the DQ pin indicates a "0". Belowing shows the timing diagram of the HY5117400A to enter Test Mode. In Test Mode, the 4M x 4DRAM can be tested as if it were a 4M x 4DRAM. WE, CAS-before-RAS cycle (Test Mode in Cycle) puts the HY5117400A into Test Mode and CAS-before-RAS or RAS-only refresh cycle puts it back into Normal Mode. In Test Mode, WE, CAS-before-RAS cycle shall be used for the refresh operation. The Test Mode function reduces test time.(1/4 in case of N test pattern)
