APPLICATION MANUAL

RICOH

ELECTRONIC DEVICES DIVISION

NO. EA-041-9803

NOTICE

1. The products and the product specifications described in this application manual are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. This application manual may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this application manual shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, computer equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire-containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this application manual.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

RN5VM1××C/D SERIES

OUTLINE

The RN5VM Series are protection ICs for over-charge/discharge of rechargeable one-cell Lithium-ion (Li+) batteries by CMOS process.

The RN5VM Series can detect over-charge/discharge of Li+ one-cell and excess load current, further include a short circuit protector for preventing large external short circuit current.

Each of these ICs is composed of three voltage detectors, a reference unit, a hysteresis circuit, and a short circuit protector. When charging voltage crosses the detector threshold from a low value to a value higher than V_{DET1} , the output of COUT pin, the output of over-charge detector/VD1, switches to low level, ..charger's negative pin level. After detecting over-charge the VD1 can be reset and the output of COUT pin becomes "H" when the VDD voltage is coming down to a level lower than " $V_{DET1} - V_{HYS1}$ ", or when a charger is disconnected from the battery pack while the VDD level is in between " V_{DET1} " and " $V_{DET1} - V_{HYS1}$ " in the RN5VM1××C version.

While in the RN5VM1××D version after detecting over-charge, any load current can not be drawn from the battery pack when the VDD voltage stays over " $V_{DET1} - V_{HYS1}$ ", excepting that the VD1 can be reset and it allows to draw load current when the VDD voltage is coming down to a level lower than " $V_{DET1} - V_{HYS1}$ " because of a cell internal discharging.

The output of DOUT pin, the output of over-discharge detector/VD2, switches to "L" after internally fixed delay time passed, when discharging voltage crosses the detector threshold from a high value to a value lower than V_{DET2} . An excess load current can be sensed and cut off after internally fixed delay time passed through the built in excess current detector, VD3, with DOUT being enabled to low level. Once after detecting excess current, the VD3 is released and DOUT level switches to "H" by detaching a battery pack from a load system.

Further, short circuit protector makes DOUT level to "L" immediately with external short circuit current and removing external short circuit leads DOUT level to "H". After detecting over-discharge, supply current will be kept extremely "L" by halting some internal circuits operation. The output delay of over-charge detectors can be set by connecting external capacitors. Output type of COUT and DOUT are CMOS. SOT23-6 is available.

FEATURES

- Low supply currentSupply current TYP. 3.0 μ A
Standby current (after detecting over-discharge) TYP. 0.3 μ A
- High withstand voltage.....Absolute maximum ratings 28V ($V_{DD}-V$)
- High accuracy detector thresholdOver-charge detector ± 50 mV
Over-discharge detector $\pm 2.5\%$
- Variety of detector threshold.....Over-charge detector threshold 4.0V to 4.4V/step of 0.01V
Over-discharge detector threshold 2.0V to 3.0V/step of 0.05V
- Built-in protection circuit.....Excess current trip/Short circuit protector
- Output delay of over-chargeTime delay at $C_3= 0.01\mu$ F and $V_{DD}=4.3$ V 75ms for RN5VM111 \times
- Ultra small packageSOT-23-6

APPLICATIONS

- Over-charge/over-discharge protection for Li+ one-cell pack
- High precision protectors for cell-phones and any other gadgets using on board Li+ one-cell battery

BLOCK DIAGRAM

SELECTION GUIDE

In the RN5VM1××× Series three of the input threshold for over-charge, over-discharge and excess current and taping type can be designating at the user's request by Part Number as follows:

RN5VM1×××-×× ← Part Number
 ↑ ↑ ↑
 a b c

Code	Description
a	Serial Number for the RN5VM Series designating input threshold for over-charge, over-discharge and excess current detectors as well as hysteresis range for over-charge detector.
b	Designation of version symbols C : drawing load current is allowable after detecting over-charge. D : drawing load current is not allowable after detecting over-charge.
c	Designation of Taping Type: TR (refer to Taping Specification)

PIN CONFIGURATION

PIN DESCRIPTION

Pin No.	Symbol	Pin description
1	COUF	Output of over-charge detection, CMOS output
2	Ct	Pin for external capacitor setting output delay of VD1
3	VSS	Ground
4	DOUT	Output of over-discharge detection, CMOS output
5	VDD	Power supply
6	V-	Pin for charger negative input

ABSOLUTE MAXIMUM RATINGS

V_{SS}=0V

Symbol	Item		Rating	Unit
V _{DD}	Supply Voltage		-0.3 to 12	V
V-	Input Voltage	V- pin	V _{DD} -28 to V _{DD} +0.3	V
V _{ct}		Ct pin	V _{SS} -0.3 to V _{DD} +0.3	V
V _{COUT}	Output Voltage	COUT pin	V _{DD} -28 to V _{DD} +0.3	V
V _{DOUT}		DOUT pin	V _{SS} -0.3 to V _{DD} +0.3	V
P _D	Power Dissipation		150	mW
T _{opt}	Operating Temperature Range		-40 to +85	°C
T _{stg}	Storage Temperature Range		-55 to +125	°C

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum ratings are threshold limit values that must not be exceeded even for an instant under any conditions. Moreover, such values for any two items must not be reached simultaneously. Operation above these absolute maximum ratings may cause degradation or permanent damage to the device. These are stress ratings only and do not necessarily imply functional operation below these limits.

TIMING DIAGRAM

• RN5VM1××C

• RN5VM1××D

OPERATION

• VD1/Over-Charge Detector

- The VD1 monitors VDD pin voltage. When the VDD voltage crosses over-charge detector threshold VDET1 from a low value to a value higher than the VDET1, the VD1 can sense over-charging and an external charge control Nch-MOS-FET turns to “OFF” with COUT pin being at “L”.
- An output delay time for over-charge detection can be set by an external capacitor C3 connecting the Vss pin and Ct pin. The external capacitor can make a delay time from a moment detecting over-charge to a time output a signal which enables charge control Nch-MOS-FET for turning to “OFF”. Though the VDD voltage would be going up to a higher level than VDET1 if it is within a time period of the output delay time, VD1 would not output a signal for turning “OFF” of charge control Nch-MOS-FET. The output delay time can be calculated as below:

$$t_{VDET1} = \frac{C_3 \times (V_{DD} - 0.7)}{0.48 \times 10^{-6}}$$

- A level shifter incorporated in a buffer driver for the COUT pin makes the “L” of COUT pin to the V- pin voltage and the “H” of COUT pin is set to VDD voltage with CMOS buffer.

Reset conditions from overcharging of RN5VM1××C

- There can be two cases to reset the VD1 making the COUT pin level to “H” again after detecting over-charge. Resetting the VD1 makes the charging system ready for resumption of charging process. The first case is in such condition that a time when the VDD voltage is coming down to a level lower than “VDET1-VHYS1”. While in the second case, disconnecting a charger from the battery pack can make the VD1 resetting when the VDD level is within hysteresis width ($V_{DET1} - V_{HYS1} \leq V_{DD} < V_{DET1}$)
- After detecting over-charge with the VDD voltage of higher than VDET1, connecting system load to the battery pack makes load current allowable through parasitic diode of external charge control Nch-MOS-FET. The COUT level would be “H” when the VDD level is coming down to a level below the VDET1 by continuous drawing of load current.

Reset conditions from overcharging of RN5VM1××D

- After detecting over-charge, the VD1 would not be released and COUT level would not switch to “H” again with the exception that a cell voltage reaches to a lower value than “VDET1-VHYS1” by self discharge of cell or else. After detecting over-charge, when the VDD level stays at a value higher than “VDET1-VHYS1”, to connect battery pack to a system load makes battery pack being disabled at for charging or discharging because of excess current detector operated being DOUT “L”.

• VD2/Over-Discharge Detector

- The VD2 monitors a VDD pin voltage. When the VDD voltage crosses the over-discharge detector threshold VDET2 from a high value to a value lower than the VDET2, the VD2 can sense an over-discharging and the external discharge control Nch-MOS-FET turns to “OFF” with the DOUT pin being at “L”.
- Resetting the VD2 with the DOUT pin level being “H” again after detecting over-discharge is only possible by connecting a charger to the battery pack. When the VDD voltage stays under over-discharge detector threshold VDET2 charge current can flow through parasitic diode of external discharge control Nch-MOS-FET, then after the VDD voltage comes up to a value larger than VDET2 discharging process would be advanced through “ON” state discharge control Nch-MOS-FET. Connecting a charger to the battery pack makes the DOUT level being “H” instantaneously when the VDD voltage is higher than VDET2.
- When a cell voltage equals to zero, connecting charger to the battery pack makes the system allowable for charge with higher charge voltage than Vst, 1.2V Max.
- An output delay time for the over-discharge detection is fixed internally. Though the VDD voltage would be going down to a lower level than VDET2 if it is within a time period of the output delay time, VD2 would not output a signal for turning “OFF” of discharge control Nch-MOS-FET.
- After detection of an over-discharge by VD2, supply current would be reduced to 0.3μA TYP. at VDD=2.0V and into standby, only the charger detector is operating.
- The output type of DOUT pin is CMOS having “H” level of VDD and “L” level of Vss.

• VD3/Excess Current Detector, Short Circuit Protector

- Both of the excess current detector and short circuit protector can work when both control Nch-MOS-FETs are in “ON” state.
When the V- pin voltage is going up to a value between the short protection voltage Vshort and excess current threshold VDET3, the excess current detector operates and further soaring of V- pin voltage higher than Vshort makes the short circuit protector enabled. As a result the external discharge control Nch-MOS-FET turns to “OFF” with the DOUT pin being at “L”.
- An output delay time for the excess current detector is internally fixed, 13ms TYP. at VDD=3.0V. A quick recovery of V- pin level from a value between Vshort and VDET3 within the delay time keeps the discharge control FET staying “ON” state.
When the short circuit protector is enabled, the DOUT would be “L” and its delay time would be 5μs TYP.
- The V- pin has a built-in pull down resistor, TYP.100kΩ, connected to the Vss pin.
After an excess current or short circuit protection is detected, removing a cause of excess current or external short circuit makes an external discharge control Nch-MOS-FET to an “ON” state automatically with the V- pin level being down to the Vss level through the built-in pull down resistor.
- When VDD voltage is higher than VDET2 at a time when the excess current is detected the 5VM does not enter a standby mode, while VDD voltage is lower than VDET2 the 5VM enters a standby mode.
After detecting short circuit the 5VM will not enter a standby mode.

20) Over-charge Threshold vs. External Resistance R1

TYPICAL APPLICATION

NOTE ON EXTERNAL COMPONENTS

- R1 and C1 will stabilize a supply voltage to the RN5VM. A recommended R1 value is less than 1kΩ. A larger value of R1 leads higher detection voltage, makes some errors, because of shoot through current flowed in the RN5VM.
- R2 and C2 will stabilize a V- pin voltage. The resetting from over-discharge with connecting charger possibly be disabled by larger value of R2. Recommended value is less than 1kΩ. After an over-charge detection, a system may not draw load current when a battery pack is connected to it in the C version with R2 and C2 time constants at relatively larger settings. Recommended C2 value is less than 1μF.
- R1 and R2 can operate as a current limiter against setting cell reverse direction or for applying excess charging voltage to the 5VM. While smaller R1 and R2 may cause an over power dissipation rating of the RN5VM and a total of “R1+R2” should be more than 1kΩ.
- The time constants $R1 \times C1$ or $R2 \times C2$ must have a relations as below:

$$R1 \times C1 \leq R2 \times C2$$
 Because in case that $R1 \times C1$, time constant for VDD pin, would be larger than $R2 \times C2$, time constant for V- pin, then the RN5VM might be into a standby mode after detecting excess current or short circuit current.
