SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## description

The TMS320C6203B and TMS320C6203C devices are part of the TMS320C62x™ fixed-point DSP generation in the TMS320C6000™ DSP platform. The C62x™ DSP devices are based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications.

The TMS320C62x™ DSP offers cost-effective solutions to high-performance DSP-programming challenges. The TMS320C6203B/03C has a performance capability of up to 2400 MIPS at a clock rate of 300 MHz. The C6203B/03C DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide six arithmetic logic units (ALUs) for a high degree of parallelism and two 16-bit multipliers for a 32-bit result. The C6203B/03C can produce two multiply-accumulates (MACs) per cycle for a total of 600 million MACs per second (MMACS). The C6203B/03C DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6203B/03C device program memory consists of two blocks, with a 256K-byte block configured as memory-mapped program space, and the other 128K-byte block user-configurable as cache or memory-mapped program space. Data memory for the C6203B/03C consists of two 256K-byte blocks of RAM.

The C6203B/03C device has a powerful and diverse set of peripherals. The peripheral set includes three multichannel buffered serial ports (McBSPs), two general-purpose timers, a 32-bit expansion bus (XBus) that offers ease of interface to synchronous or asynchronous industry-standard host bus protocols, and a glueless 32-bit external memory interface (EMIF) capable of interfacing to SDRAM or SBRAM and asynchronous peripherals.

The C62x™ devices have a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

## device characteristics

Table 1 provides an overview of the TMS320C6203C, TMS320C6203B, TMS320C6202/02B, and the TMS320C6204 DSPs. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count, etc. This data sheet primarily focuses on the functionality of the TMS320C6203B/03C devices although it also identifies to the user the pin-compatibility of the C6203B and C6202/02B GLS, and the C6204 GLW BGA packages. For the functionality information on the TMS320C6202/02B devices, see the *TMS320C6202, TMS320C6202B Fixed-Point Digital Signal Processors* data sheet (literature number SPRS104). For the functionality information on the TMS320C6204 device, see the *TMS320C6204 Fixed-Point Digital Signal Processor* data sheet (literature number SPRS152). And for more details on the C6000™ DSP part numbering, see Figure 4.

PRODUCT PREVIEW

## **C62x™ device compatibility**

The TMS320C6202, C6202B, C6203B, C6203C, and C6204 devices are pin-compatible; thus, making new system designs easier and providing faster time to market. The following list summarizes the C62x™ DSP device characteristic differences:

- Core Supply Voltage (1.8 V versus 1.5 V versus 1.2 V)

The C6202 device core supply voltage is 1.8 V while the C6202B, C6203B, C6204 devices have core supply voltages of 1.5 V and the C6203C device has a core supply voltage of 1.2 V.

- PLL Options Availability

Table 1 identifies the available PLL multiply factors [e.g., CLKIN x1 (PLL bypassed), x4, etc.] for each of the C62x™ DSP devices. For additional details on the PLL clock module and specific options for the C6203B/03C devices, see the *Clock PLL* section of this data sheet.

For additional details on the PLL clock module and specific options for the C6202/02B devices, see the *Clock PLL* section of the *TMS320C6202, TMS320C6202B Fixed-Point Digital Signal Processors* data sheet (literature number SPRS104).

And for additional details on the PLL clock module and specific options for the C6204 device, see the *Clock PLL* section of the *TMS320C6204 Fixed-Point Digital Signal Processor* data sheet (literature number SPRS152).

- On-Chip Memory Size

The C6202/02B, C6203B/03C, and C6204 devices have different on-chip program memory and data memory sizes (see Table 1).

- McBSPs

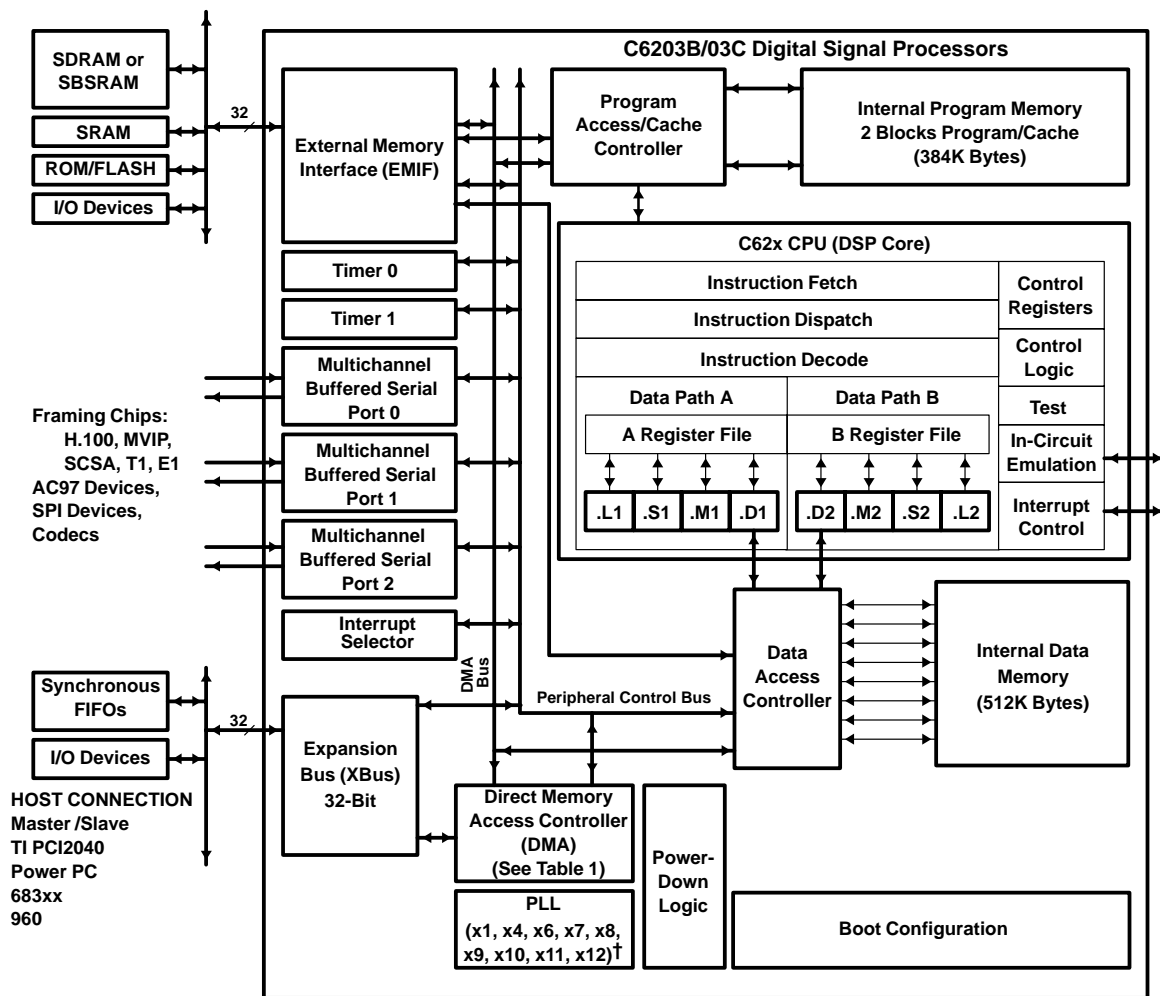

The C6202, C6202B, C6203B, and C6203C devices have three McBSPs while the C6204 device has two McBSPs on-chip.

For a more detailed discussion on migration concerns, and similarities/differences between the C6202, C6202B, C6203B, C6203C, and C6204 devices, see the *How to Begin Development and Migrate Across the TMS320C6202/6202B/6203B/6204 DSPs* application report (literature number SPRA603).

SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## functional and CPU (DSP core) block diagram

† For additional details on the PLL clock module and specific options for the C6203B/03C devices, see Table 1 and the *Clock PLL* section of this data sheet.

## **CPU (DSP core) description**

The CPU fetches VelociTI™ advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C62x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional and CPU (DSP core) block diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

Another key feature of the C62x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C62x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the 256-bit-wide fetch-packet boundary, the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

## CPU (DSP core) description (continued)

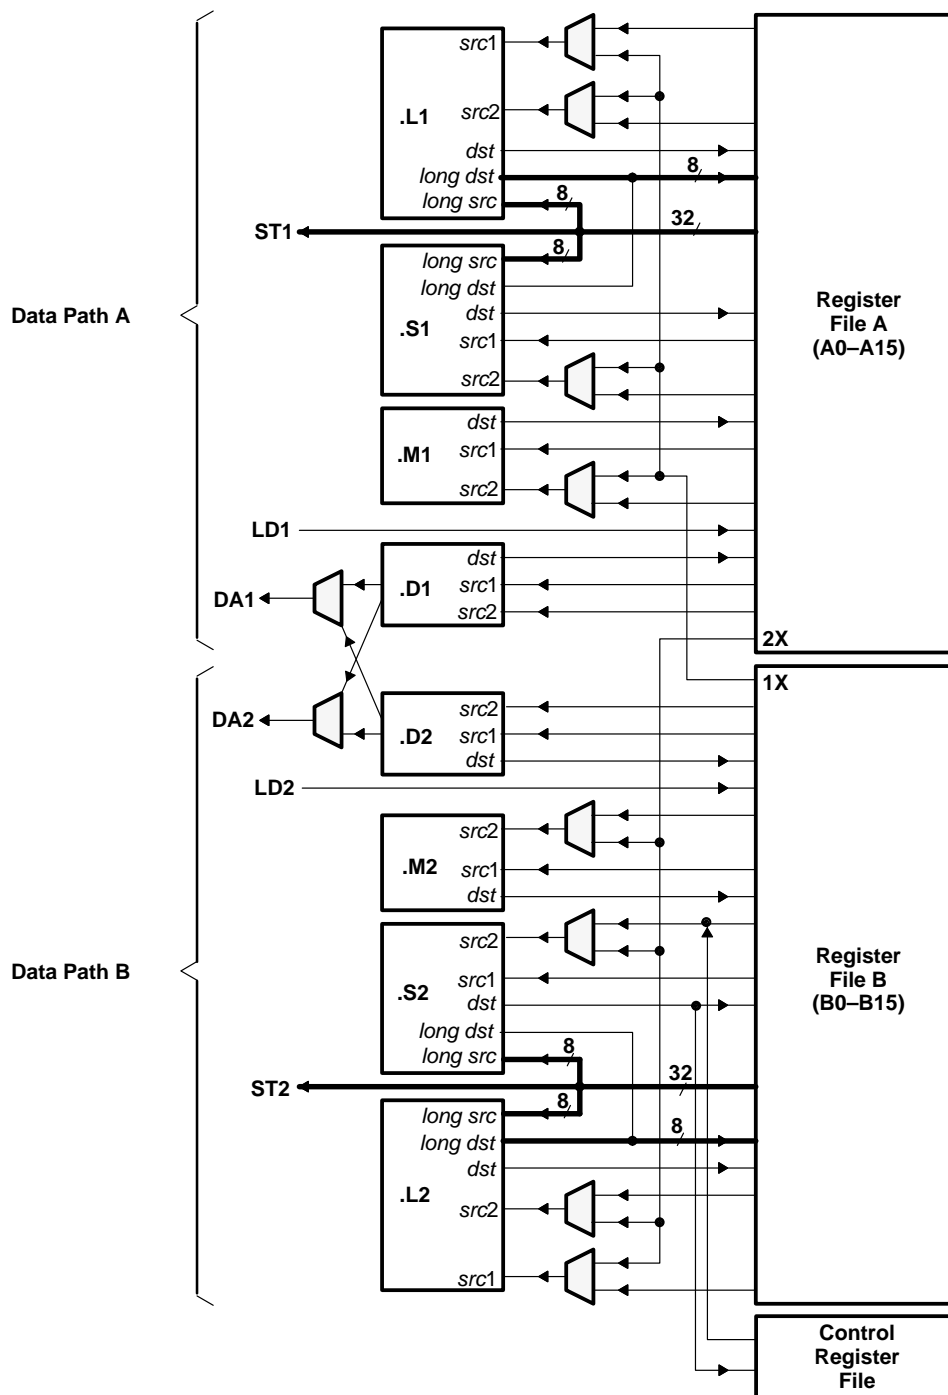

Figure 1. TMS320C62x CPU (DSP Core) Data Paths

## memory map summary

Table 2 shows the memory map address ranges of the C6203B/03C device. The C6203B/03C device has the capability of a MAP 0 or MAP 1 memory block configuration. These memory block configurations are set up at reset by the boot configuration pins (generically called BOOTMODE[4:0]). For the C6203B/03C device, the BOOTMODE configuration is handled, at reset, by the expansion bus module (specifically XD[4:0] pins). For more detailed information on the C6203B/03C device settings, which include the device boot mode configuration at reset and other device-specific configurations, see the Boot Configuration section and the Boot Configuration Summary table of the *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190).

## DMA synchronization events

The C6203B/C6203C DMA supports up to four independent programmable DMA channels, plus an auxiliary channel used for servicing the HPI module. The four main DMA channels can be read/write synchronized based on the events shown in Table 3. Selection of these events is done via the RSYNC and WSYNC fields in the Primary Control registers of the specific DMA channel. For more detailed information on the DMA module, associated channels, and event-synchronization, see the Direct Memory Access (DMA) Controller chapter of the *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190).

**Table 3. TMS320C6203B/03C DMA Synchronization Events**

DMA EVENT NUMBER (BINARY)	EVENT NAME	EVENT DESCRIPTION
00000	Reserved	Reserved
00001	TINT0	Timer 0 interrupt
00010	TINT1	Timer 1 interrupt

PRODUCT PREVIEW

## interrupt sources and interrupt selector

The C62x DSP core supports 16 prioritized interrupts, which are listed in Table 4. The highest-priority interrupt is INT\_00 (dedicated to RESET) while the lowest-priority interrupt is INT\_15. The first four interrupts (INT\_00–INT\_03) are non-maskable and fixed. The remaining interrupts (INT\_04–INT\_15) are maskable and default to the interrupt source specified in Table 4. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

**Table 4. C6203B/03C DSP Interrupts**

† Interrupts INT\_00 through INT\_03 are non-maskable and fixed.

‡ Interrupts INT\_04 through INT\_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 4 shows the default interrupt sources for Interrupts INT\_04 through INT\_15. For more detailed information on interrupt sources and selection, see the Interrupt Selector and External Interrupts chapter of the *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190).

### Signal Descriptions

SIGNAL NAME	PIN NO.		TYPE†	DESCRIPTION
	GNZ	GLS/ GNY		
CLOCK/PLL				
CLKIN	C12	B10	I	Clock input
CLKOUT1	AD20	Y18	O	Clock output at full device speed
CLKOUT2	AC19	AB19	O	Clock output at half (1/2) of device speed (C6203B only)  Clock output at half (1/2) or at quarter (1/4) of device speed, dependent on SCRT (XD7 pin) [C6203C only]. When SCRT (XD7 pin) = 0, then the clock output is at half of device speed When SCRT (XD7 pin) = 1, then the clock output is at quarter of device speed <ul style="list-style-type: none"><li>Used for synchronous memory interface</li></ul>
CLKMODE0	B15	B12	I	Clock mode selects <ul style="list-style-type: none"><li>Selects what multiply factors of the input clock frequency the CPU frequency equals.</li></ul> For more details on the GNZ, GLS, and GNY CLKMODE pins and the PLL multiply factors for the C6203B and C6203C devices, see the <i>Clock PLL</i> section of this data sheet.
CLKMODE1	C11	A9	I	
CLKMODE2	–	A14	I	
PLL $\nabla$	D13	C11	A $\S$	PLL analog V <sub>CC</sub> connection for the low-pass filter
PLL $\nabla$	D14	C12	A $\S$	PLL analog GND connection for the low-pass filter
PLL $\nabla$	C13	A11	A $\S$	PLL low-pass filter connection to external components and a bypass capacitor
JTAG EMULATION				
TMS	AD7	Y5	I	JTAG test-port mode select (features an internal pullup)
TDO	AE6	AA4	O/Z	JTAG test-port data out
TDI	AF5	Y4	I	JTAG test-port data in (features an internal pullup)
TCK	AE5	AB2	I	JTAG test-port clock
$\overline{\text{TRST}}$	AC7	AA3	I	JTAG test-port reset (features an internal pulldown)
EMU1	AF6	AA5	I/O/Z	Emulation pin 1, pullup with a dedicated 20-k $\Omega$ resistor¶
EMU0	AC8	AB4	I/O/Z	Emulation pin 0, pullup with a dedicated 20-k $\Omega$ resistor¶
RESET AND INTERRUPTS				
$\overline{\text{RESET}}$	K2	J3	I	Device reset
NMI	L2	K2	I	Nonmaskable interrupt <ul style="list-style-type: none"><li>Edge-driven (rising edge)</li></ul>
EXT_INT7	V4	U2	I	External interrupts <ul style="list-style-type: none"><li>Edge-driven</li><li>Polarity independently selected via the External Interrupt Polarity Register bits (EXTPOL[3:0])</li></ul>
EXT_INT6	Y2	U3		
EXT_INT5	AA1	W1		
EXT_INT4	W4	V2		
IACK	Y1	V1	O	Interrupt acknowledge for all active interrupts serviced by the CPU
INUM3	V2	R3	O	Active interrupt identification number <ul style="list-style-type: none"><li>Valid during IACK for all active interrupts (not just external)</li><li>Encoding order follows the interrupt-service fetch-packet ordering</li></ul>
INUM2	U4	T1		
INUM1	V3	T2		
INUM0	W2	T3		

† I = Input, O = Output, Z = High Impedance, S = Supply Voltage, GND = Ground

‡ PLLV, PLLG, and PLLF are not part of external voltage supply or ground. See the *clock PLL* section for information on how to connect these pins.

§ A = Analog Signal (PLL Filter)

¶ For emulation and normal operation, pull up EMU1 and EMU0 with a dedicated 20-kΩ resistor. For boundary scan, pull down EMU1 and EMU0 with a dedicated 20-kΩ resistor.

## development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

### Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE) including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

### Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)

EVM (Evaluation Module)

The *TMS320 DSP Development Support Reference Guide* (SPRU011) contains information about development-support products for all TMS320™ DSP family member devices, including documentation. See this document for further information on TMS320™ DSP documentation or any TMS320™ DSP support products from Texas Instruments. An additional document, the *TMS320 Third-Party Support Reference Guide* (SPRU052), contains information about TMS320™ DSP-related products from other companies in the industry. To receive TMS320™ DSP literature, contact the Literature Response Center at 800/477-8924.

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL) and select “Find Development Tools”. For device-specific tools, under “Semiconductor Products” select “Digital Signal Processors”, choose a product family, and select the particular DSP device. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, DSP/BIOS, XDS, and TMS320 are trademarks of Texas Instruments.

## **device and development-support tool nomenclature**

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP devices and support tools. Each TMS320™ DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

<b>TMX</b>	Experimental device that is not necessarily representative of the final device's electrical specifications
<b>TMP</b>	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
<b>TMS</b>	Fully qualified production device

Support tool development evolutionary flow:

<b>TMDX</b>	Development-support product that has not yet completed Texas Instruments internal qualification testing.
<b>TMDS</b>	Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

“Developmental product is intended for internal evaluation purposes.”

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

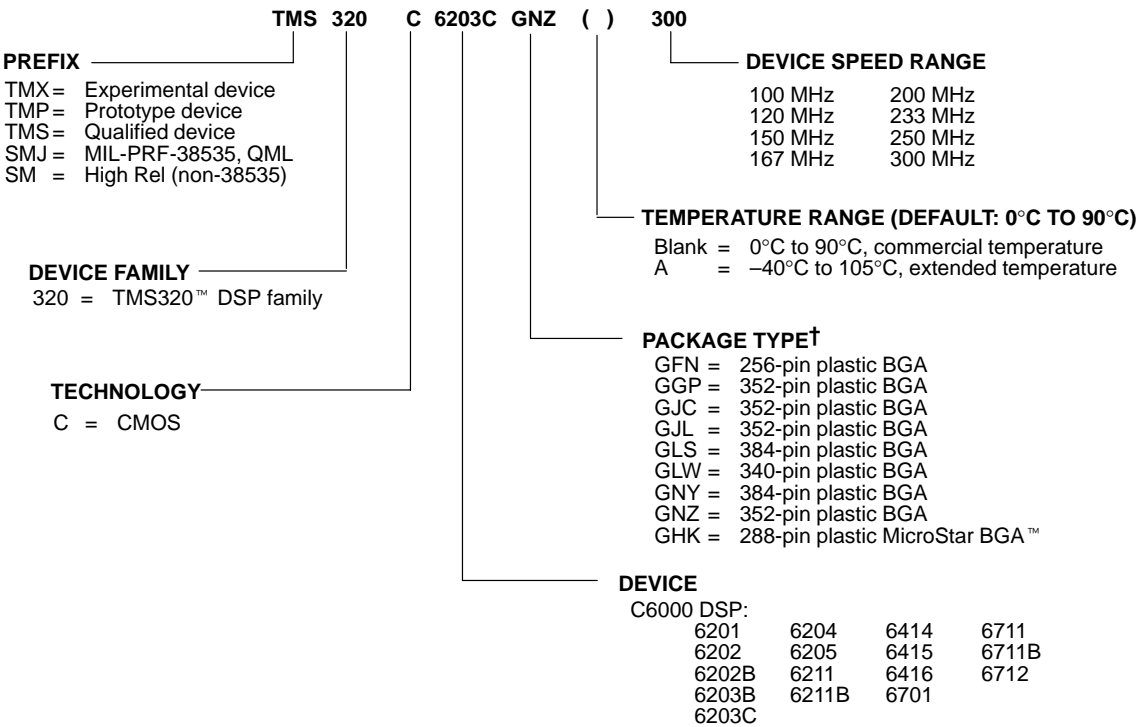

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLS), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -300 is 300 MHz).

Figure 4 provides a legend for reading the complete device name for any member of the TMS320C6000™ DSP platform. For the C6203B/03C device orderable part numbers (P/Ns), see the Texas Instruments web site on the Worldwide web at <http://www.ti.com> URL, or contact the nearest TI field sales office, or authorized distributor.

## documentation support

Extensive documentation supports all TMS320™ DSP family devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ CPU (DSP core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190) describes the functionality of the peripherals available on the C6000™ DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), 32-/16-bit host-port interfaces (HPs), multichannel buffered serial ports (McBSPs), direct memory access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XBus), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); and power-down modes. This guide also includes information on internal data and program memories.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the TMS320C62x™/TMS320C67x™ devices, associated development tools, and third-party support.

The *How to Begin Development and Migrate Across the TMS320C6202/6202B/6203B/6204 DSPs* application report (literature number SPRA603) describes the migration concerns and identifies the similarities and differences between the C6202, C6202B, C6203B, C6203C, and C6204 C6000™ DSP devices.

The tools support documentation is electronically available within the Code Composer Studio™ IDE. For a complete listing of the latest C6000™ DSP documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

TMS320C67x is a trademark of Texas Instruments.

# TMS320C6203B, TMS320C6203C FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## clock PLL

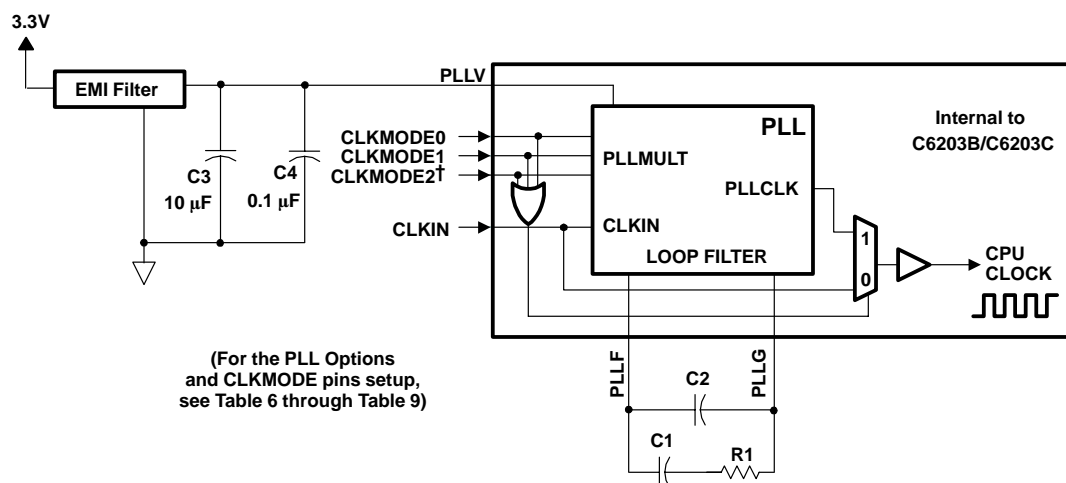

Most of the internal C6203B/03C clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5, and Table 6 through Table 8 show the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 6 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C6203B/03C device and the external clock oscillator circuit. Noise coupling into PLLF directly impacts PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section. Table 5 lists some examples of compatible CLKIN external clock sources:

**Table 5. Compatible CLKIN External Clock Sources**

COMPATIBLE PARTS FOR EXTERNAL CLOCK SOURCES (CLKIN)	PART NUMBER	MANUFACTURER
Oscillators	JITO-2	Fox Electronix
	STA series, ST4100 series	SaRonix Corporation
	SG-636	Epson America
	342	Corning Frequency Control
PLL	MK1711-S, ICS525-02	Integrated Circuit Systems

† The CLKMODE2 pin is not available for the C6203C GNZ package.

- NOTES:
- A. Keep the lead length and the number of vias between pin PLLF, pin PLLG, R1, C1, and C2 to a minimum. In addition, place all PLL components (R1, C1, C2, C3, C4, and EMI Filter) as close to the C6000™ DSP device as possible. Best performance is achieved with the PLL components on a single side of the board without jumpers, switches, or components other than the ones shown.
  - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI Filter).
  - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.
  - D. EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCET103U.

**Figure 5. External PLL Circuitry for Either PLL Multiply Modes or x1 (Bypass) Mode**

clock PLL (continued)

† The CLKMODE2 pin is not available for the C6203C GNZ package.

- NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF to PLLG.  
B. The 3.3-V supply for PLLV must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.

SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## clock PLL (continued)

**Table 8. TMS320C6203B PLL Component Selection Table†**

CLKMODE‡	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 [±1%] (Revision No.)	C1 [±10%] (Revision No.)	C2 [±10%] (Revision No.)	TYPICAL LOCK TIME (μs)
x4	32.5–75	130–300	65–150	60.4 Ω (1.x) 45.3 Ω (2.x, 3.x)	27 nF (1.x) 47 nF (2.x, 3.x)	560 pF (1.x) 10 pF (2.x, 3.x)	75
x6	21.7–50						
x7	18.6–42.9						
x8	16.3–37.5						
x9	14.4–33.3						
x10	13–30						
x11	11.8–27.3						

† Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

‡ CLKMODE x1, x4, x6, x7, x8, x9, x10, and x11 apply to the GLS/GNY devices [C6203B only].

**Table 9. TMS320C6203C PLL Component Selection Table†**

CLKMODE‡	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 [±1%]§¶	C1 [±10%]§¶	C2 [±10%]§¶	TYPICAL LOCK TIME (μs)
x4	32–75	128–400	64–200	45.3–60.4 Ω	27–47 nF	10–560 pF	75
x6	32–66.67						
x8	32–50						
x12	32–33.33						

† Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

‡ CLKMODE x1, x4, x6, x8, and x12 apply to the GNY device. The GNZ device is restricted to x1, x4, x8, and x12 multiply factors.

§ The PLL component selection for the C6203C device is specified as a range because the C6203C device can use the same PLL components as the C6203B, C6202/02B, or C6204 devices.

¶ For the C6203C device, the R1, C1, and C2 components are not required; however, for the benefit of being able to migrate between the C6203B, C6202/02B, and C6204 devices, it is recommended that these components be installed.

## power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

## system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

## power-supply design considerations

For systems using the C6000™ DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, as many as five external clock cycle pulses may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the *Using the TPS56300 to Power DSPs* application report (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## PARAMETER MEASUREMENT INFORMATION (CONTINUED)

### timing parameters and board routing analysis

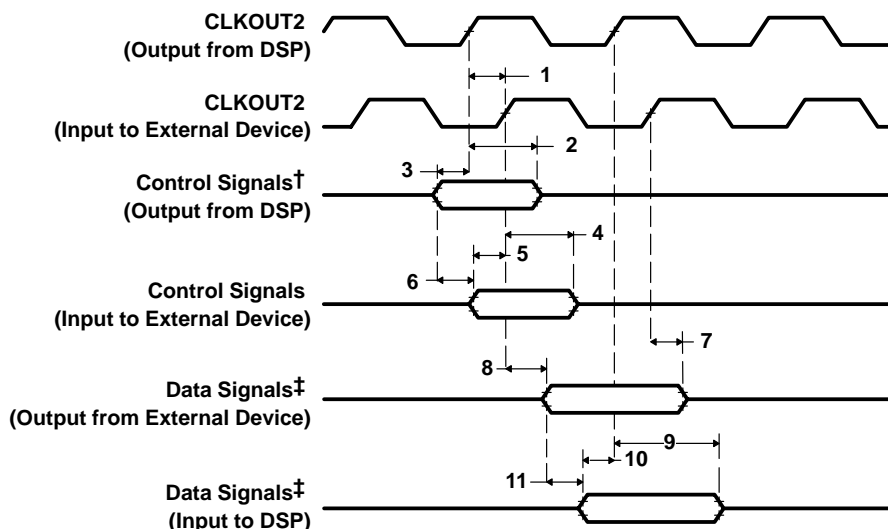

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 10 and Figure 10).

Figure 10 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

**Table 10. IBIS Timing Parameters Example (see Figure 10)**

NO.	DESCRIPTION
1	Clock route delay
2	Minimum DSP hold time
3	Minimum DSP setup time
4	External device hold time requirement
5	External device setup time requirement
6	Control signal route delay
7	External device hold time
8	External device access time
9	DSP hold time requirement
10	DSP setup time requirement
11	Data route delay

† Control signals include data for Writes.

‡ Data signals are generated during Reads from an external device.

**Figure 10. IBIS Input/Output Timings**

## INPUT AND OUTPUT CLOCKS

### timing requirements for CLKIN (PLL used)<sup>†‡§</sup> (see Figure 11)

NO.		C6203B-250		C6203B-300		C6203C-300		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_c(\text{CLKIN})$ Cycle time, CLKIN	4 * M		3.33 * M		3.33 * M		ns
2	$t_w(\text{CLKINH})$ Pulse duration, CLKIN high	0.4C		0.4C		0.4C		ns
3	$t_w(\text{CLKINL})$ Pulse duration, CLKIN low	0.4C		0.4C		0.4C		ns
4	$t_t(\text{CLKIN})$ Transition time, CLKIN	5		5		5		ns

<sup>†</sup> The reference points for the rise and fall transitions are measured at  $V_{IL}$  MAX and  $V_{IH}$  MIN.

<sup>‡</sup> M = the PLL multiplier factor (x4, x6, x7, x8, x9, x10, or x11) for C6203B GLS and GNY only.

M = the PLL multiplier factor (x4, x8, or x12) for C6203C GNZ only. M = the PLL multiplier factor (x4, x6, x8, or x12) for C6203C GNY only.

For more details on both devices, see the *Clock PLL* section of this data sheet.

<sup>§</sup> C = CLKIN cycle time in ns. For example, when CLKIN frequency is 50 MHz, use C = 20 ns.

### timing requirements for CLKIN [PLL bypassed (x1)]<sup>†¶</sup> (see Figure 11)

NO.		C6203B-250		C6203B-300		C6203C-300		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_c(\text{CLKIN})$ Cycle time, CLKIN	4		3.33		TBD		ns
2	$t_w(\text{CLKINH})$ Pulse duration, CLKIN high	0.45C		0.45C		0.45C		ns
3	$t_w(\text{CLKINL})$ Pulse duration, CLKIN low	0.45C		0.45C		0.45C		ns
4	$t_t(\text{CLKIN})$ Transition time, CLKIN	0.6		0.6		0.6		ns

<sup>†</sup> The reference points for the rise and fall transitions are measured at  $V_{IL}$  MAX and  $V_{IH}$  MIN.

<sup>¶</sup> C = CLKIN cycle time in ns. For example, when CLKIN frequency is 50 MHz, use C = 20 ns. The maximum CLKIN cycle time in PLL bypass mode (x1) is 200 MHz.

**Figure 11. CLKIN Timings**

SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## INPUT AND OUTPUT CLOCKS (CONTINUED)

timing requirements for XCLKIN† (see Figure 12)

NO.		C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
1	$t_c(\text{XCLKIN})$ Cycle time, XCLKIN	4P	ns
2	$t_w(\text{XCLKINH})$ Pulse duration, XCLKIN high	1.8P	ns
3	$t_w(\text{XCLKINL})$ Pulse duration, XCLKIN low	1.8P	ns

† P = 1/CPU clock frequency in nanoseconds (ns).

Figure 12. XCLKIN Timings

switching characteristics over recommended operating conditions for CLKOUT2‡§ (see Figure 13)

NO.	PARAMETER	C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
1	$t_c(\text{CKO2})$ Cycle time, CLKOUT2	2P – 0.7 2P + 0.7	ns
2	$t_w(\text{CKO2H})$ Pulse duration, CLKOUT2 high	P – 0.7 P + 0.7	ns
3	$t_w(\text{CKO2L})$ Pulse duration, CLKOUT2 low	P – 0.7 P + 0.7	ns

‡ For the C6203B device only, P = 1/CPU clock frequency in ns.

For the C6203C device only:

If the SCRT (XD7 pin) is pulled down (0) then, P = 1/CPU clock frequency in ns.

If the SCRT (XD7 pin) is pulled up (1) then, P = 2(1/CPU clock frequency in ns).

§ The reference points for the rise and fall transitions are measured at  $V_{OL\ MAX}$  and  $V_{OH\ MIN}$ .

Figure 13. CLKOUT2 Timings

INPUT AND OUTPUT CLOCKS (CONTINUED)

SPRS086F – JANUARY 1999 – REVISED SEPTEMBER 2001

## ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles<sup>†‡§¶</sup> (see Figure 15 – Figure 18)

NO.		C6203B-250 C6203B-300		C6203C-300		UNIT
		MIN	MAX	MIN	MAX	
3	$t_{su}(EDV-AREH)$ Setup time, EDx valid before $\overline{ARE}$ high	1		3		ns
4	$t_h(AREH-EDV)$ Hold time, EDx valid after $\overline{ARE}$ high	4.9		1		ns
6	$t_{su}(ARDYH-AREL)$ Setup time, ARDY high before $\overline{ARE}$ low	$-[(RST - 3) * P - 6]$		$-[(RST - 3) * P - 6]$		ns
7	$t_h(AREL-ARDYH)$ Hold time, ARDY high after $\overline{ARE}$ low	$(RST - 3) * P + 2$		$(RST - 3) * P + 2$		ns
9	$t_{su}(ARDYL-AREL)$ Setup time, ARDY low before $\overline{ARE}$ low	$-[(RST - 3) * P - 6]$		$-[(RST - 3) * P - 6]$		ns
10	$t_h(AREL-ARDYL)$ Hold time, ARDY low after $\overline{ARE}$ low	$(RST - 3) * P + 2$		$(RST - 3) * P + 2$		ns
11	$t_w(ARDYH)$ Pulse width, ARDY high	2P		2P		ns
15	$t_{su}(ARDYH-AWEL)$ Setup time, ARDY high before $\overline{AWEL}$ low	$-[(WST - 3) * P - 6]$		$-[(WST - 3) * P - 6]$		ns
16	$t_h(AWEL-ARDYH)$ Hold time, ARDY high after $\overline{AWEL}$ low	$(WST - 3) * P + 2$		$(WST - 3) * P + 2$		ns
18	$t_{su}(ARDYL-AWEL)$ Setup time, ARDY low before $\overline{AWEL}$ low	$-[(WST - 3) * P - 6]$		$-[(WST - 3) * P - 6]$		ns
19	$t_h(AWEL-ARDYL)$ Hold time, ARDY low after $\overline{AWEL}$ low	$(WST - 3) * P + 2$		$(WST - 3) * P + 2$		ns

<sup>†</sup> To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

<sup>‡</sup> RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the EMIF CE space control registers.

<sup>§</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

<sup>¶</sup> The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use ARDY input to extend strobe width.

PRODUCT PREVIEW

### ASYNCHRONOUS MEMORY TIMING (CONTINUED)

switching characteristics over recommended operating conditions for asynchronous memory cycles<sup>†‡§¶</sup> (see Figure 15 – Figure 18)

## HOLD/HOLDA TIMING

timing requirements for the  $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$  cycles<sup>†</sup> (see Figure 27)

NO.		C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
3	$t_{oh}(\overline{\text{HOLDAL}}-\overline{\text{HOLDL}})$ Output hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low	P	ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

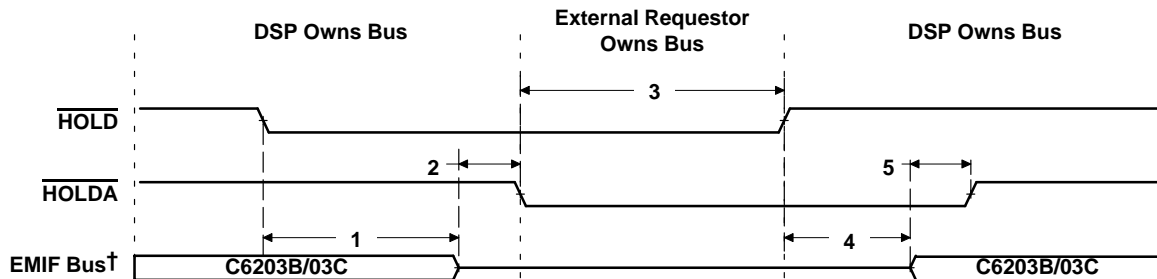

switching characteristics over recommended operating conditions for the  $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$  cycles<sup>†‡</sup> (see Figure 27)

NO.	PARAMETER	C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
1	$t_d(\overline{\text{HOLDL}}-\text{EMHZ})$ Delay time, $\overline{\text{HOLD}}$ low to EMIF Bus high impedance	3P §	ns
2	$t_d(\text{EMHZ}-\overline{\text{HOLDAL}})$ Delay time, EMIF Bus high impedance to $\overline{\text{HOLDA}}$ low	0 2P	ns
4	$t_d(\overline{\text{HOLDH}}-\text{EMLZ})$ Delay time, $\overline{\text{HOLD}}$ high to EMIF Bus low impedance	3P 7P	ns
5	$t_d(\text{EMLZ}-\overline{\text{HOLDAH}})$ Delay time, EMIF Bus low impedance to $\overline{\text{HOLDA}}$ high	0 2P	ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

<sup>‡</sup> EMIF Bus consists of  $\overline{\text{CE}}[3:0]$ ,  $\overline{\text{BE}}[3:0]$ ,  $\overline{\text{ED}}[31:0]$ ,  $\overline{\text{EA}}[21:2]$ ,  $\overline{\text{ARE}}$ ,  $\overline{\text{AOE}}$ ,  $\overline{\text{AWE}}$ ,  $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$ ,  $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$ ,  $\overline{\text{SDWE}}/\overline{\text{SSWE}}$ , and SDA10.

§ All pending EMIF transactions are allowed to complete before  $\overline{\text{HOLDA}}$  is asserted. The worst case for this is an asynchronous read or write with external ARDY used or a minimum of eight consecutive SDRAM reads or writes when RBTR8 = 1. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

<sup>†</sup> EMIF Bus consists of  $\overline{\text{CE}}[3:0]$ ,  $\overline{\text{BE}}[3:0]$ ,  $\overline{\text{ED}}[31:0]$ ,  $\overline{\text{EA}}[21:2]$ ,  $\overline{\text{ARE}}$ ,  $\overline{\text{AOE}}$ ,  $\overline{\text{AWE}}$ ,  $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$ ,  $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$ ,  $\overline{\text{SDWE}}/\overline{\text{SSWE}}$ , and SDA10.

Figure 27.  $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$  Timing

## RESET TIMING

timing requirements for reset<sup>†</sup> (see Figure 28)

NO.			C6203B-250 C6203B-300 C6203C-300	UNIT
			MIN    MAX	
1	$t_{w(RST)}$	Width of the $\overline{RESET}$ pulse (PLL stable) <sup>‡</sup>	10P	ns
		Width of the $\overline{RESET}$ pulse (PLL needs to sync up) <sup>§</sup>	250	μs
10	$t_{su(XD)}$	Setup time, XD configuration bits valid before $\overline{RESET}$ high <sup>¶</sup>	5P	ns
11	$t_h(XD)$	Hold time, XD configuration bits valid after $\overline{RESET}$ high <sup>¶</sup>	5P	ns

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.33 ns.

<sup>‡</sup> This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4, x6, x8, and x12 when CLKIN and PLL are stable for C6203B. And applies to CLKMODE x4, x6, x8, and x12 when CLKIN and PLL are stable for C6203C.

<sup>§</sup> This parameter applies to CLKMODE x4, x6, x7, x8, x9, x10, and x11 only (it does not apply to CLKMODE x1) for C6203B. This parameter applies to CLKMODE x4, x6, x8, and x12 only (it does not apply to CLKMODE x1) for C6203C. The  $\overline{RESET}$  signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time,  $\overline{RESET}$  must be asserted to ensure proper device operation. See the *Clock PLL* section for PLL lock times.

<sup>¶</sup> XD[31:0] are the boot configuration pins during device reset.

switching characteristics over recommended operating conditions during reset<sup>†#</sup> (see Figure 28)

NO.	PARAMETER		C6203B-250 C6203B-300 C6203C-300	UNIT

## EXPANSION BUS ASYNCHRONOUS PERIPHERAL TIMING

timing requirements for asynchronous peripheral cycles†‡§¶ (see Figure 33–Figure 36)

NO.			C6203B-250 C6203B-300		C6203C-300		UNIT
			MIN	MAX	MIN	MAX	
3	$t_{su}(XDV-XREH)$	Setup time, XDx valid before $\overline{XRE}$ high	4.5		3		ns
4	$t_h(XREH-XDV)$	Hold time, XDx valid after $\overline{XRE}$ high	2.5		1		ns
6	$t_{su}(XRDYH-XREL)$	Setup time, XRDY high before $\overline{XRE}$ low	$-[(RST - 3) * P - 6]$		$-[(RST - 3) * P - 6]$		ns
7	$t_h(XREL-XRDYH)$	Hold time, XRDY high after $\overline{XRE}$ low	$(RST - 3) * P + 2$		$(RST - 3) * P + 2$		ns
9	$t_{su}(XRDYL-XREL)$	Setup time, XRDY low before $\overline{XRE}$ low	$-[(RST - 3) * P - 6]$		$-[(RST - 3) * P - 6]$		ns
10	$t_h(XREL-XRDYL)$	Hold time, XRDY low after $\overline{XRE}$ low	$(RST - 3) * P + 2$		$(RST - 3) * P + 2$		ns
11	$t_w(XRDYH)$	Pulse width, XRDY high	2P		2P		ns
15	$t_{su}(XRDYH-XWEL)$	Setup time, XRDY high before $\overline{XWE}$ low	$-[(WST - 3) * P - 6]$		$-[(WST - 3) * P - 6]$		ns
16	$t_h(XWEL-XRDYH)$	Hold time, XRDY high after $\overline{XWE}$ low	$(WST - 3) * P + 2$		$(WST - 3) * P + 2$		ns
18	$t_{su}(XRDYL-XWEL)$	Setup time, XRDY low before $\overline{XWE}$ low	$-[(WST - 3) * P - 6]$		$-[(WST - 3) * P - 6]$		ns
19	$t_h(XWEL-XRDYL)$	Hold time, XRDY low after $\overline{XWE}$ low	$(WST - 3) * P + 2$		$(WST - 3) * P + 2$		ns

† To ensure data setup time, simply program the strobe width wide enough. XRDY is internally synchronized. If XRDY does meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, XRDY can be an asynchronous input.

‡ RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the XBUS XCE space control registers.

§ P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

¶ The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use XRDY input to extend strobe width.

PRODUCT PREVIEW

			CLKX ext	2	1		
11	t <sub>h</sub> (CKXL-FXH)	Hold time, external FSX high after CLKX low	CLKX int	6	6		ns
			CLKX ext	4	3		

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

<sup>§</sup> The maximum bit rate for the C6203B/03C device is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 300 MHz (P = 3.3 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>¶</sup> The minimum CLKR/X pulse duration is either (P – 1) or 4 ns, whichever is larger. For example, when running parts at 300 MHz (P = 3.3 ns), use 4 ns as the minimum CLKR/X pulse duration. When running parts at 100 MHz (P = 10 ns), use (P – 1) = 9 ns as the minimum CLKR/X pulse duration.

PRODUCT PREVIEW

¶ FSRP = FSXP = 1. As a SPI master, FSX is inverted to provide active-low slave-enable output. As a slave, the active-low signal input on FSX and FSR is inverted before being used internally.

CLKXM = FSXM = 1, CLKRM = FSRM = 0 for master McBSP

CLKXM = CLKRM = FSXM = FSRM = 0 for slave McBSP

# FSX should be low before the rising edge of clock to enable slave devices and then begin a SPI transfer at the rising edge of the master clock (CLKX).

PRODUCT PREVIEW

MULTICHANNEL BUFFERED SERIAL PORT TIMING (CONTINUED)

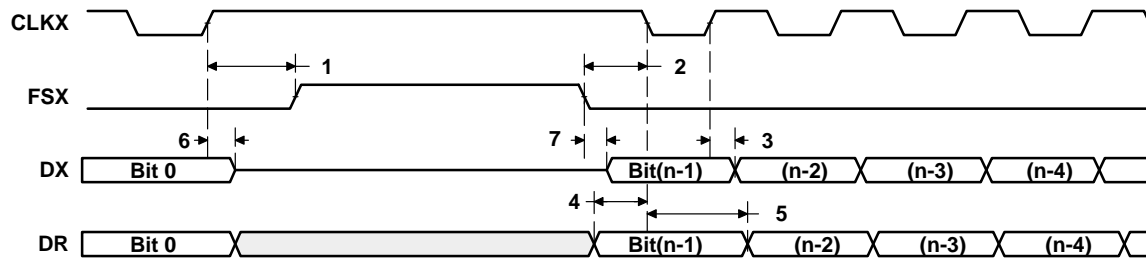

Figure 51. McBSP Timing as SPI Master or Slave: CLKSTP = 11b, CLKXP = 1

## DMAC, TIMER, POWER-DOWN TIMING

switching characteristics over recommended operating conditions for DMAC outputs†  
(see Figure 52)

NO.	PARAMETER	C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
1	$t_w(\text{DMACH})$ Pulse duration, DMAC high	2P–3	ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

Figure 52. DMAC Timing

timing requirements for timer inputs† (see Figure 53)

NO.	PARAMETER	C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
1	$t_w(\text{TINPH})$ Pulse duration, TINP high	2P	ns
2	$t_w(\text{TINPL})$ Pulse duration, TINP low	2P	ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

switching characteristics over recommended operating conditions for timer outputs†  
(see Figure 53)

NO.	PARAMETER	C6203B-250 C6203B-300 C6203C-300	UNIT
		MIN MAX	
3	$t_w(\text{TOUTH})$ Pulse duration, TOUT high	2P–3	ns
4	$t_w(\text{TOU TL})$ Pulse duration, TOUT low	2P–3	ns

† P = 1/CPU clock frequency in ns. For example, when running parts at 300 MHz, use P = 3.3 ns.

## **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
