

AD7520/AD7530 10-Bit, AD7521/AD7531 12-Bit Binary Multiplying D/A Converters

General Description

The AD7520 and the AD7521 are, respectively, 10 and 12-bit binary multiplying digital-to-analog converters. A deposited thin film R-2R resistor ladder divides the reference current and provides the circuit with excellent temperature tracking characteristics (typically $0.0002\%/\text{ }^{\circ}\text{C}$ linearity error temperature coefficient). The circuit uses CMOS current switches and drive circuitry to achieve low power consumption (30 mW max) and low leakages (200 nA max). The digital inputs are compatible with DTL/TTL logic levels as well as full CMOS logic level swings. This part, combined with an external amplifier and voltage reference, can be used as a standard D/A converter; however, it is also very attractive for multiplying applications (such as digitally controlled gain blocks) since its linearity error is essentially independent of the voltage reference.

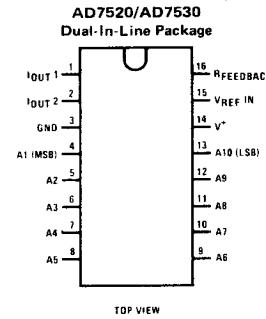

This part is available with 10-bit (0.05%), 9-bit (0.10%), and 8-bit (0.20%) non-linearity. The AD7520L, AD7520K, and AD7520J are direct replacements for

the 10-bit resolution AD7520 and AD7530 family, and equivalent to AD7533 family. The AD7521K, AD7521J and AD7521L are direct replacements for the 12-bit resolution AD7521 and AD7531 family. For more information, see DAC1020 data sheet.

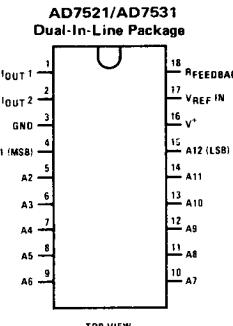

Features

- Linearity specified with zero and full-scale adjust only
- Integrated thin film on CMOS structure
- 10-bit or 12-bit resolution
- Low power dissipation 10 mW @ 15V typ
- Accepts variable or fixed reference $-25\text{V} \leq V_{\text{REF}} \leq +25\text{V}$
- 4-quadrant multiplying capability
- Interfaces directly with DTL, TTL and CMOS
- Fast settling time—600 ns typ
- Low feedthrough error— $1/2$ LSB @ 100 kHz typ

	All Digital Inputs Low		-50	-200		-50	-200	μA
Operating Power Supply Range		5		15	5		15	V

Note 1: V_{REF} = ±10V and V_{REF} = ±1V.

Note 2: Using internal feedback resistor.

Note 3: Both I_{OUT1} and I_{OUT2} must go to ground or the virtual ground of an operational amplifier. For every millivolt offset between I_{OUT1} or I_{OUT2}, 0.005% linearity error will be introduced.

Note 4: To achieve this low feedthrough in D package, the user must ground the metal lid.
