GENERAL DESCRIPTION

The Am2168 and Am2169 are high-performance, static, N-channel, read/write, random-access memories organized as 4096 words of 4 bits. Operation is from a single 5 V supply, and all input/output levels are identical to standard TTL specifications. The Am2168 and Am2169 are the same except that the Am2168 offers an automatic Chip Enable (CE) power-down feature.

The Am2168 remains in a low-power standby mode as long as CE remains HIGH, thus reducing its power requirements from 660 mW to 165 mW maximum.

The data read out is not destructive and has the same polarity as the input data. The device is packaged in either a .300 slim DIP or 20-pin leadless chip carrier. The outputs of similar devices can be OR-tied and easy selection obtained by use of the CE.

PIN DESCRIPTION

A₀-A₁₁ Address Inputs (Inputs)

The address input lines select the RAM location to be read or written.

CE Chip Enable (Input, Active LOW)

The Chip Enable selects the memory device.

WE Write Enable (Input, Active LOW)

When Write Enable is LOW and Chip Enable is also LOW, data is written into the location specified on the address pins.

I/O₁-I/O₄ Data In/Out Bus (Bidirectional Active HIGH)

These I/O lines provide the path for data to be read from or written to the selected memory location.

- Notes: 1. Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V and output loading of the specified I_{OL}/I_{OH} and 30 pF load capacitance. Output timing reference is 1.5 V.
 2. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
 3. V_{IL} voltages of less than -0.5 V on the I/O pins will cause the output current to exceed the maximum rating and thus should not exceed 30 seconds in duration.
 4. For test and correlation purposes, ambient temperature is defined as the "Instant-on" case temperature.
 5. At any given temperature and voltage condition, t_{HZ} is less than t_{LZ} and t_{WZ} is less than t_{OW} for all devices. Transition is measured at 1.5 V on the input to V_{OH} - 500 mV and V_{OL} + 500 mV on the outputs using the load shown in B. under Switching Test Circuits. C_L = 5 pF.
 6. Not 100% tested parameter; parameter guaranteed by characterization.
