

FEATURES

- ❑ 20 ns Worst-Case Multiply Time
- ❑ Low Power CMOS Technology
- ❑ Replaces Cypress CY7C517, IDT 7217L, and AMD Am29517
- ❑ Single Clock Architecture with Register Enables
- ❑ Two's Complement, Unsigned, or Mixed Operands
- ❑ Three-State Outputs
- ❑ DECC SMD No. 5962-87686
- ❑ Available 100% Screened to MIL-STD-883, Class B
- ❑ Package Styles Available:
 - 68-pin Plastic LCC, J-Lead
 - 68-pin Ceramic LCC
 - 64-pin Ceramic Flatpack

DESCRIPTION

The LMU217 is a high-speed, low power 16-bit parallel multiplier. Full military ambient temperature range operation is attained by the use of advanced CMOS technology.

The LMU217 produces the 32-bit product of two 16-bit numbers. Data present at the A inputs, along with the TCA control bit, is loaded into the A register on the rising edge of CLK. B data and the TCB control bit are similarly loaded. Loading of the A and B registers is controlled by the $\overline{\text{ENA}}$ and $\overline{\text{ENB}}$ controls. When HIGH, these controls prevent application of the clock to the respective register. The TCA and TCB controls specify the operands as two's complement when

HIGH, or unsigned magnitude when LOW.

RND is loaded on the rising edge of CLK, provided either $\overline{\text{ENA}}$ or $\overline{\text{ENB}}$ are LOW. RND, when HIGH, adds '1' to the most significant bit position of the least significant half of the product. Subsequent truncation of the 16 least significant bits produces a result correctly rounded to 16-bit precision.

At the output, the Right Shift control (RS) selects either of two output formats. RS LOW produces a 31-bit product with a copy of the sign bit inserted in the MSB position of the least significant half. RS HIGH gives a full 32-bit product. Two 16-bit output registers are provided to hold the most and least significant halves of the result (MSP and LSP) as defined by RS. These registers are loaded on the rising edge of CLK, subject to the $\overline{\text{ENR}}$ control. When $\overline{\text{ENR}}$ is HIGH, clocking of the result registers is prevented.

For asynchronous output, these registers may be made transparent by setting the feed through control (FT) HIGH and $\overline{\text{ENR}}$ LOW.

The two halves of the product may be routed to a single 16-bit three-state output port (MSP) via a multiplexer. MSPSEL LOW causes the MSP outputs to be driven by the most significant half of the result. MSPSEL HIGH routes the least significant half of the result to the MSP pins. In addition, the LSP is available via the B port through a separate three-state buffer.

16 x 16-bit Parallel Multiplier
MAXIMUM RATINGS *Above which useful life may be impaired (Notes 1, 2, 3, 8)*

Storage temperature	–65°C to +150°C
Operating ambient temperature	–55°C to +125°C
V _{CC} supply voltage with respect to ground	–0.5 V to +7.0 V
Input signal with respect to ground	–3.0 V to +7.0 V
Signal applied to high impedance output	–3.0 V to +7.0 V
Output current into low outputs	25 mA
Latchup current	> 400 mA

OPERATING CONDITIONS *To meet specified electrical and switching characteristics*

Mode	Temperature Range (Ambient)	Supply Voltage
Active Operation, Commercial	0°C to +70°C	4.75 V ≤ V _{CC} ≤ 5.25 V
Active Operation, Military	–55°C to +125°C	4.50 V ≤ V _{CC} ≤ 5.50 V

ELECTRICAL CHARACTERISTICS *Over Operating Conditions (Note 4)*

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
V _{OH}	Output High Voltage	V _{CC} = Min., I _{OH} = –2.0 mA	2.4			V
V _{OL}	Output Low Voltage	V _{CC} = Min., I _{OL} = 8.0 mA			0.5	V
V _{IH}	Input High Voltage		2.0		V _{CC}	V
V _{IL}	Input Low Voltage	(Note 3)	0.0		0.8	V
I _{Ix}	Input Current	Ground ≤ V _{IN} ≤ V _{CC} (Note 12)			±20	μA
I _{OZ}	Output Leakage Current	Ground ≤ V _{OUT} ≤ V _{CC} (Note 12)			±20	μA
I _{CC1}	V _{CC} Current, Dynamic	(Notes 5, 6)		12	25	mA
I _{CC2}	V _{CC} Current, Quiescent	(Note 7)			1.0	mA

SWITCHING WAVEFORMS

NOTES

1. Maximum Ratings indicate stress specifications only. Functional operation of these products at values beyond those indicated in the Operating Conditions table is not implied. Exposure to maximum rating conditions for extended periods may affect reliability.

2. The products described by this specification include internal circuitry designed to protect the chip from damaging substrate injection currents and accumulations of static charge. Nevertheless, conventional precautions should be observed during storage, handling, and use of these circuits in order to avoid exposure to excessive electrical stress values.

3. This device provides hard clamping of transient undershoot and overshoot. Input levels below ground or above VCC will be clamped beginning at -0.6 V and VCC + 0.6 V. The device can withstand indefinite operation with inputs in the range of -0.5 V to +7.0 V. Device operation will not be adversely affected, however, input current levels will be well in excess of 100 mA.

4. Actual test conditions may vary from those designated but operation is guaranteed as specified.

5. Supply current for a given application can be accurately approximated by:

$$\frac{NCV^2F}{4}$$

where

- N = total number of device outputs
- C = capacitive load per output
- V = supply voltage
- F = clock frequency

6. Tested with all outputs changing every cycle and no load, at a 5 MHz clock rate.

7. Tested with all inputs within 0.1 V of VCC or Ground, no load.

8. These parameters are guaranteed but not 100% tested.

9. AC specifications are tested with input transition times less than 3 ns, output reference levels of 1.5 V (except tDIS test), and input levels of nominally 0 to 3.0 V. Output loading may be a resistive divider which provides for specified IOH and IOL at an output voltage of VOH min and VOL max respectively. Alternatively, a diode bridge with upper and lower current sources of IOH and IOL respectively, and a balancing voltage of 1.5 V may be used. Parasitic capacitance is 30 pF minimum, and may be distributed.

This device has high-speed outputs capable of large instantaneous current pulses and fast turn-on/turn-off times. As a result, care must be exercised in the testing of this device. The following measures are recommended:

- a. A 0.1 μ F ceramic capacitor should be installed between VCC and Ground leads as close to the Device Under Test (DUT) as possible. Similar capacitors should be installed between device VCC and the tester common, and device ground and tester common.
- b. Ground and VCC supply planes must be brought directly to the DUT socket or contactor fingers.
- c. Input voltages should be adjusted to compensate for inductive ground and VCC noise to maintain required DUT input levels relative to the DUT ground pin.

10. Each parameter is shown as a minimum or maximum value. Input requirements are specified from the point of view of the external system driving the chip. Setup time, for example, is specified as a minimum since the external system must supply at least that much time to meet the worst-case requirements of all parts. Responses from the internal circuitry are specified from the point of view of the device. Output delay, for example, is specified as a maximum since worst-case operation of any device always provides data within that time.

11. For the tENA test, the transition is measured to the 1.5 V crossing point with datasheet loads. For the tDIS test, the transition is measured to the ± 200 mV level from the measured steady-state output voltage with ± 10 mA loads. The balancing voltage, VTH, is set at 3.5 V for Z-to-0 and 0-to-Z tests, and set at 0 V for Z-to-1 and 1-to-Z tests.

12. These parameters are only tested at the high temperature extreme, which is the worst case for leakage current.
