The RCA-CD54/74HC/HCT354 and CD54/74HC/HCT356 are data selectors/multiplexers that select one of eight sources. In both the HC/HCT354 and HC/HCT356 the data select bits S0, S1, and S2 are stored in transparent latches that are enabled by a low latch enable input, $\overline{LE}$.

In the HC/HCT354 the data enable input, $\overline{E}$, controls transparent latches that pass data to the outputs when $\overline{E}$ is high and latches in new data when $\overline{E}$ is low.

In the HC/HCT356 the data is stored in edge-triggered flip-flops that are triggered by a low-to-high clock transition.

In both types the three-state outputs are controlled by three output-enable inputs $\overline{OE1}$, $\overline{OE2}$, and $\overline{OE3}$.

The CD54HC/HCT354/356 are supplied in 20-lead ceramic dual-in-line packages (F suffix). The CD74HC/HCT354/356 are supplied in 20-lead plastic dual-in-line plastic packages (E suffix). The CD54/74HC/HCT354/356 are also supplied in chip form (H suffix). The CD74HC/HCT354/356 are also available in plastic surface mounted packages (M suffix).
