1/ Unused inputs that do not directly control the pin under test shall be $\ge$ 2.5 V or $\le$ 0.4 V, and shall not exceed 5.5 V or go less than 0.0 V. No inputs shall be floating.
2/ All outputs shall be tested. In the case where only one input at V_{IL} maximum or V_{IH} minimum produces the proper output state, the test shall be performed with each input being selected as the V_{IL} maximum or V_{IH} minimum input.
3/ The output conditions have been chosen to produce a current that closely approximates one half of the true short circuit output current, I_{OS}. Not more than one output shall be tested at a time and the duration of the test shall not exceed one second.
4/ Propagation delay limits are based on single output switching. Unused outputs = 3.5 V or $\le$ 0.3 V. The load circuit shall consist of the specified R_L and C_L in series, with R_L tied to V_{CC} and C_L tied to GND. The device test point shall be the node between C_L and R_L.
