GENERAL DESCRIPTION

Zilog's Z86E04/E08 Microcontrollers (MCU) are One-Time Programmable (OTP) members of the Z8[®] single-chip microcontroller family which allow easy software development, debug, prototyping, and small production runs not economically desirable with masked ROM versions.

For applications demanding powerful I/O capabilities, the Z86E04/E08's dedicated input and output lines are grouped into three ports, and are configurable under software control to provide timing, status signals, or parallel I/O.

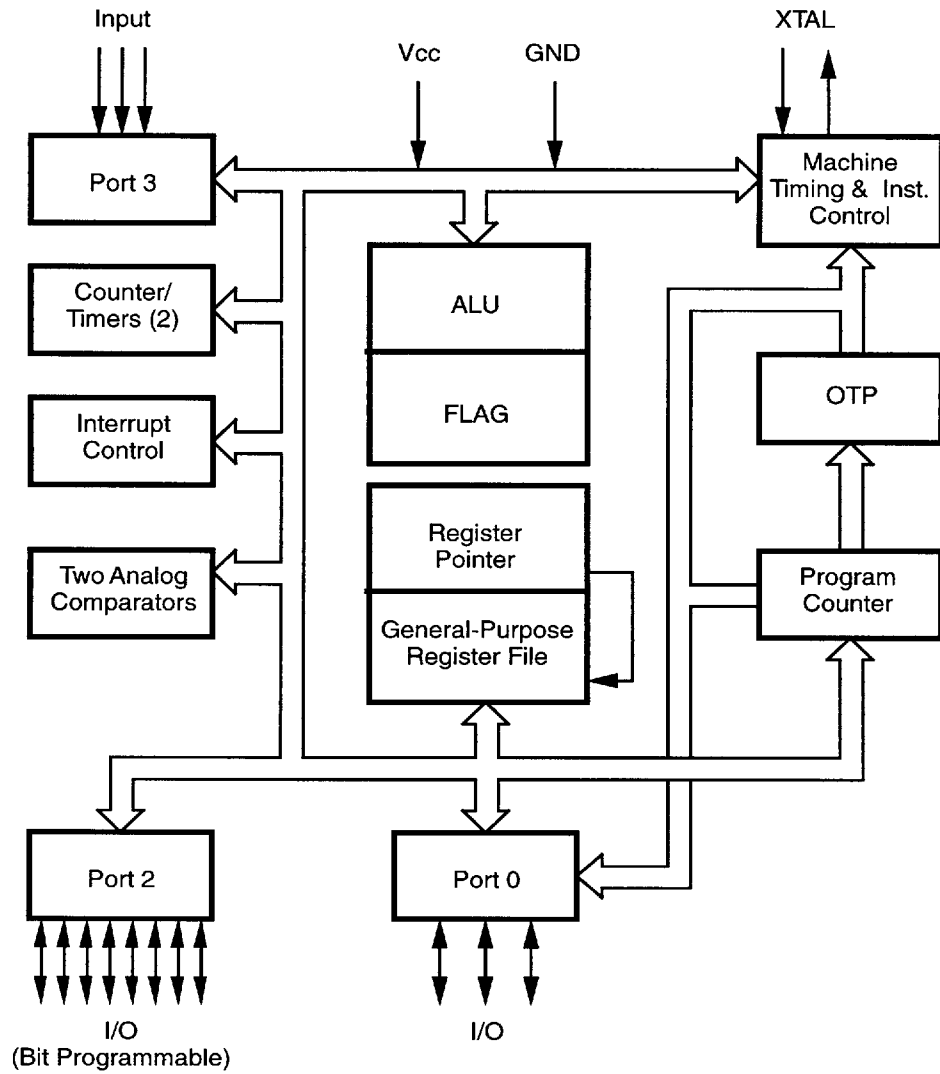

Two on-chip counter/timers, with a large number of user selectable modes, offload the system of administering real-time tasks such as counting/timing and I/O data communications.

Note: All Signals with a preceding front slash, "/", are active Low, e.g.: B/ /W (WORD is active Low); /B/W (BYTE is active Low, only).

Power connections follow conventional descriptions below:

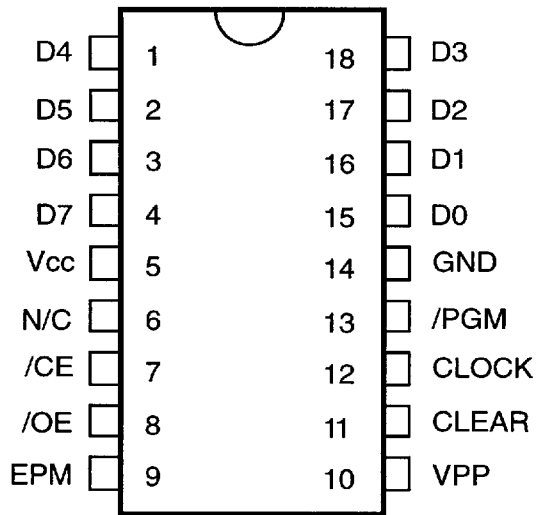

Connection	Circuit	Device
Power Ground	V _{CC} GND	V _{DD} V _{SS}

Notes:

- * Voltages on all pins with respect to GND.
- † See Ordering Information

Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; operation of the device in any condition above those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

- [3] The device operates down to V_{RST} of the specified frequency for V_{RST}. The minimum operational V_{CC} is determined on the value of the voltage V_{RST} at the ambient temperature. The V_{RST} increases as the temperature decreases.
- [4] V_{CC} = 3.0V to 5.5V, typical values measured at V_{CC} = 3.3V and V_{CC} = 5.0V.
- [5] Standard Mode (not Low EMI mode)
- [6] Z86E08 only.
