

## 256MB - 32Mx64 DDR SDRAM UNBUFFERED, w/PLL

### FEATURES

- DDR200, DDR266 and DDR333
- Double-data-rate architecture
- Bi-directional data strobes (DQS)
- Differential clock inputs (CK & CK#)
- Programmable Read Latency 2,2.5 (clock)
- Programmable Burst Length (2,4,8)
- Programmable Burst type (sequential & interleave)
- Edge aligned data output, center aligned data input
- Auto and self refresh
- Serial presence detect
- Power supply: 2.5V  $\pm$  0.20V
- JEDEC standard 200 pin SO-DIMM package
  - Package height options:
    - AD4: 35.5mm (1.38")
    - BD4: 31.75mm (1.25")

### DESCRIPTION

The W3EG6433S is a 32Mx64 Double Data Rate SDRAM memory module based on 256Mb DDR SDRAM component. The module consists of eight 32Mx8 DDR SDRAMs in 66 pin TSOP package mounted on a 200 Pin FR4 substrate.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges and Burst Lengths allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

\* This product is under development, is not qualified or characterized and is subject to change without notice.

NOTE: Consult factory for availability of:

- Lead-Free or RoHS Products
- Vendor source control options
- Industrial temperature option

### OPERATING FREQUENCIES

	DDR333 @CL=2.5	DDR266 @CL=2	DDR266 @CL=2.5	DDR200 @CL=2
Clock Speed	166MHz	133MHz	133MHz	100MHz
CL-trCD-trP	2.5-3-3	2-2-2	2.5-3-3	2-2-2

### PIN CONFIGURATIONS

### PIN NAMES

A0 – A12	Address input (Multiplexed)
BA0-BA1	Bank Select Address
DQ0-DQ63	Data Input/Output
DQS0-DQS8	Data Strobe Input/Output
CK0	Clock input
CK0#	Clock input
CKE0	Clock Enable Input
CS0#	Chip select Input
RAS#	Row Address Strobe
CAS#	Column Address Strobe
WE#	Write Enable
DQM0-DQM8	Data-In Mask
VCC	Power Supply
VCCQ	Power Supply for DQS
VSS	Ground
VREF	Power Supply for Reference
VCCSPD	Serial EEPROM Power Supply
SDA	Serial data I/O
SCL	Serial clock
SA0-SA2	Address in EEPROM
VCCID	Vcc Identification Flag
NC	No Connect

**FUNCTIONAL BLOCK DIAGRAM**

**ABSOLUTE MAXIMUM RATINGS**

Parameter	Symbol	Value	Units
Voltage on any pin relative to Vss	V <sub>IN</sub> , V <sub>OUT</sub>	-0.5 to 3.6	V
Voltage on V <sub>CC</sub> supply relative to Vss	V <sub>CC</sub> , V <sub>CCQ</sub>	-1.0 to 3.6	V
Storage Temperature	T <sub>STG</sub>	-55 to +150	°C
Power Dissipation	P <sub>D</sub>	8	W
Short Circuit Current	I <sub>OS</sub>	50	mA

## Note:

Permanent device damage may occur if "ABSOLUTE MAXIMUM RATINGS" are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

**DC CHARACTERISTICS**0°C ≤ T<sub>A</sub> ≤ 70°C, V<sub>CC</sub> = 2.5V ± 0.2V

Parameter	Symbol	Min	Max	Unit
Supply Voltage	V <sub>CC</sub>	2.3	2.7	V
Supply Voltage	V <sub>CCQ</sub>	2.3	2.7	V
Reference Voltage	V <sub>REF</sub>	V <sub>CCQ</sub> /2 - 50mV	V <sub>CCQ</sub> /2 + 50mV	V
Termination Voltage	V <sub>TT</sub>	V <sub>REF</sub> - 0.04	V <sub>REF</sub> + 0.04	V
Input High Voltage	V <sub>IH</sub>	V <sub>REF</sub> + 0.15	V <sub>CCQ</sub> + 0.3	V
Input Low Voltage	V <sub>IL</sub>	-0.3	V <sub>REF</sub> - 0.15	V
Output High Voltage	V <sub>OH</sub>	V <sub>TT</sub> + 0.76	—	V
Output Low Voltage	V <sub>OL</sub>	—	V <sub>TT</sub> - 0.76	V

**CAPACITANCE**T<sub>A</sub> = 25°C, f = 1MHz, V<sub>CC</sub> = 3.3V, V<sub>REF</sub> = 1.4V ± 200mV

Parameter	Symbol	Max	Unit
Input Capacitance (A0-A12)	C <sub>IN1</sub>	29	pF
Input Capacitance (RAS#, CAS#, WE#)	C <sub>IN2</sub>	29	pF
Input Capacitance (CKE0)	C <sub>IN3</sub>	29	pF
Input Capacitance (CK0,CK0#)	C <sub>IN4</sub>	5.5	pF
Input Capacitance (CS0#)	C <sub>IN5</sub>	29	pF
Input Capacitance (DQM0-DQM8)	C <sub>IN6</sub>	8	pF
Input Capacitance (BA0-BA1)	C <sub>IN7</sub>	29	pF
Data input/output capacitance (DQ0-DQ63)(DQS)	C <sub>OUT</sub>	8	pF

### I<sub>DD</sub> SPECIFICATIONS AND TEST CONDITIONS

Recommended operating conditions, 0°C ≤ T<sub>A</sub> ≤ 70°C, V<sub>CCQ</sub> = 2.5V ±0.2V, V<sub>CC</sub> = 2.5V ±0.2V

**DETAILED TEST CONDITIONS FOR DDR SDRAM I<sub>DD1</sub> & I<sub>DD7A</sub>****I<sub>DD1</sub> : OPERATING CURRENT : ONE BANK**

1. Typical Case :  $V_{CC}=2.5V$ ,  $T=25^{\circ}C$
2. Worst Case :  $V_{CC}=2.7V$ ,  $T=10^{\circ}C$
3. Only one bank is accessed with  $t_{RC}$  (min), Burst Mode, Address and Control inputs on NOP edge are changing once per clock cycle.  $I_{OUT} = 0mA$
4. Timing Patterns :
  - DDR200 (100 MHz, CL=2) :  $t_{CK}=10ns$ , CL2, BL=4,  $t_{RCD}=2*t_{CK}$ ,  $t_{RAS}=5*t_{CK}$   
Read : A0 N R0 N N P0 N A0 N - repeat the same timing with random address changing; 50% of data changing at every burst
  - DDR266 (133MHz, CL=2.5) :  $t_{CK}=7.5ns$ , CL=2.5, BL=4,  $t_{RCD}=3*t_{CK}$ ,  $t_{RC}=9*t_{CK}$ ,  $t_{RAS}=5*t_{CK}$   
Read : A0 N N R0 N P0 N N N A0 N - repeat the same timing with random address changing; 50% of data changing at every burst
  - DDR266 (133MHz, CL=2) :  $t_{CK}=7.5ns$ , CL=2, BL=4,  $t_{RCD}=3*t_{CK}$ ,  $t_{RC}=9*t_{CK}$ ,  $t_{RAS}=5*t_{CK}$   
Read : A0 N N R0 N P0 N N N A0 N - repeat the same timing with random address changing; 50% of data changing at every burst
  - DDR333 (166MHz, CL=2.5) :  $t_{CK}=6ns$ , BL=4,  $t_{RCD}=10*t_{CK}$ ,  $t_{RAS}=7*t_{CK}$   
Read : A0 N N R0 N P0 N N N A0 N - repeat the same timing with random address changing; 50% of data changing at every burst

**I<sub>DD7A</sub> : OPERATING CURRENT : FOUR BANKS**

1. Typical Case :  $V_{CC}=2.5V$ ,  $T=25^{\circ}C$
2. Worst Case :  $V_{CC}=2.7V$ ,  $T=10^{\circ}C$
3. Four banks are being interleaved with  $t_{RC}$  (min), Burst Mode, Address and Control inputs on NOP edge are not changing.  $I_{OUT}=0mA$
4. Timing Patterns :
  - DDR200 (100 MHz, CL=2) :  $t_{CK}=10ns$ , CL2, BL=4,  $t_{RRD}=2*t_{CK}$ ,  $t_{RCD}=3*t_{CK}$ , Read with Autoprecharge  
Read : A0 N A1 R0 A2 R1 A3 R2 A0 R3 A1 R0 - repeat the same timing with random address changing; 100% of data changing at every burst
  - DDR266 (133MHz, CL=2.5) :  $t_{CK}=7.5ns$ , CL=2.5, BL=4,  $t_{RRD}=3*t_{CK}$ ,  $t_{RCD}=3*t_{CK}$   
Read with Autoprecharge  
Read : A0 N A1 R0 A2 R1 A3 R2 N R3 A0 N A1 R0 - repeat the same timing with random address changing; 100% of data changing at every burst
  - DDR266 (133MHz, CL=2) :  $t_{CK}=7.5ns$ , CL2=2, BL=4,  $t_{RRD}=2*t_{CK}$ ,  $t_{RCD}=2*t_{CK}$   
Read : A0 N A1 R0 A2 R1 A3 R2 N R3 A0 N A1 R0 - repeat the same timing with random address changing; 100% of data changing at every burst
  - DDR333 (166MHz, CL=2.5) :  $t_{CK}=6ns$ , BL=4,  $t_{RRD}=3*t_{CK}$ ,  $t_{RCD}=3*t_{CK}$ , Read with Autoprecharge  
Read : A0 N A1 R0 A2 R1 A3 R2 N R3 A0 N A1 R0 - repeat the same timing with random address changing; 100% of data changing at every burst

## Notes

1. All voltages referenced to  $V_{SS}$ .
2. Tests for AC timing,  $I_{DD}$ , and electrical AC and DC characteristics may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. Outputs measured with equivalent load:

4. AC timing and  $I_{DD}$  tests may use a  $V_{IL}$ -to- $V_{IH}$  swing of up to 1.5V in the test environment, but input timing is still referenced to  $V_{REF}$  (or to the crossing point for CK/CK#), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals used to test the device is 1V/ns in the range between  $V_{IL}(AC)$  and  $V_{IH}(AC)$ .
5. The AC and DC input level specifications are as defined in the SSTL\_2 Standard (i.e., the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above [below] the DC input LOW [HIGH] level).
6.  $V_{REF}$  is expected to equal  $V_{CCQ2}$  of the transmitting device and to track variations in the DC level of the same. Peak-to-peak noise (non-common mode) on  $V_{REF}$  may not exceed  $\pm 2$  percent of the DC value. Thus, from  $V_{CCQ2}$ ,  $V_{REF}$  is allowed  $\pm 25$ mV for DC error and an additional  $\pm 25$ mV for AC noise. This measurement is to be taken at the nearest  $V_{REF}$  bypass capacitor.
7.  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$  and must track variations in the DC level of  $V_{REF}$ .
8.  $I_{DD}$  is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time at CL = 2 for 262, 263, and 202, CL = 2.5 for 335 and 265 with the outputs open.
9. Enables on-chip refresh and address counters.
10.  $I_{DD}$  specifications are tested after the device is properly initialized, and is averaged at the defined cycle rate.
11. This parameter is sampled.  $V_{CC} = +2.5V \pm 0.2V$ ,  $V_{CCQ} = +2.5V \pm 0.2V$ ,  $V_{REF} = V_{SS}$ ,  $f = 100$  MHz,  $T = 25^\circ C$ ,  $V_{OUT}(DC) = V_{CCQ2}$ ,  $V_{OUT}$  (peak to peak)  $T_A = 0.2V$ . DM input is grouped with I/O pins, reflecting the fact that they are matched in loading.
12. For slew rates less than 1 V/ns and greater than or equal to 0.5 V/ns. If slew rate is less than 0.5 V/ns, timing must be derated:  $t_{IS}$  has an additional 50ps per each 100mV/ns reduction in slew rate from 500mV/ns, while  $t_{IH}$  is unaffected. If slew rate exceeds 4.5 V/ns, functionality is uncertain. For 335, slew rates must be  $\geq 0.5$  V/ns.
13. The CK/CK# input reference level (for timing referenced to CK/CK#) is the point at which CK and CK# cross; the input reference level for signals other than CK/CK# is  $V_{REF}$ .
14. Inputs are not recognized as valid until  $V_{REF}$  stabilizes. Exception: during the period before  $V_{REF}$  stabilizes,  $CKE < 0.3 \times V_{CCQ}$  is recognized as LOW.
15. The output timing reference level, as measured at the timing reference point indicated in Note 3, is  $V_{TT}$ .
16.  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ) or begins driving (LZ).
17. The intent of the Don't Care state after completion of the postamble is the DQS-driven signal should either be high, low, or high-Z and that any signal transition within the input switching region must follow valid input requirements. That is, if DQS transitions high (above  $V_{IH}$  DC (MIN)) then it must not transition low (below  $V_{IH}$  DC) prior to  $t_{DQSH}$  (MIN).
18. This is not a device limit. The device will operate with a negative value, but system performance could be degraded due to bus turnaround.
19. It is recommended that DQS be valid (HIGH or LOW) on or before the WRITE command. The case shown (DQS going from High-Z to logic LOW) applies when no WRITES were previously in progress on the bus. If a previous WRITE was in progress, DQS could be HIGH during this time, depending on  $t_{BOSS}$ .
20. MIN ( $t_{RC}$  or  $t_{RFC}$ ) for  $I_{DD}$  measurements is the smallest multiple of  $t_{CK}$  that meets the minimum absolute Value for the respective parameter.  $t_{RAS}$  (MAX) for  $I_{DD}$  measurements is the largest multiple of  $t_{CK}$  that meets the maximum absolute value for  $t_{RAS}$ .
21. The refresh period 64ms. This equates to an average refresh rate of 7.8125 $\mu$ s. However, an AUTO REFRESH command must be asserted at least once every 70.3 $\mu$ s; burst refreshing or posting by the DRAM controller greater than eight refresh cycles is not allowed.
22. The valid data window is derived by achieving other specifications:  $t_{HP}$  ( $t_{CK2}$ ),  $t_{BOSS}$ , and  $t_{OH}$  ( $t_{OH} = t_{HP} - t_{OHS}$ ). The data valid window derates directly proportional with the clock duty cycle and a practical data valid window can be derived. The clock is allowed a maximum duty cycle variation of 45/55, beyond which functionality is uncertain. Figure 8, Derating Data Valid Window, shows derating curves for duty cycles ranging between 50/50 and 45/55.
23. Each byte lane has a corresponding DQS.
24. This limit is actually a nominal value and does not result in a fail value.  $CKE$  is HIGH during REFRESH command period ( $t_{RFC}$  [MIN]) else  $CKE$  is LOW (i.e., during standby).
25. To maintain a valid level, the transitioning edge of the input must:
  - a. Sustain a constant slew rate from the current AC level through to the target AC level,  $V_{IL}(AC)$  or  $V_{IH}(AC)$ .
  - b. Reach at least the target AC level. After the AC target level is reached, continue to maintain at least the target DC level,  $V_{IL}(DC)$  or  $V_{IH}(DC)$ .
26. JEDEC specifies CK and CK# input slew rate must be  $\geq 1V/ns$  (2V/ns differentially).
27. DQ and DM input slew rates must not deviate from DQS by more than 10 percent. If the DQ/ DM/DQS slew rate is less than 0.5V/ns, timing must be derated: 50ps must be added to  $t_{OS}$  and  $t_{OH}$  for each 100mV/ns reduction in slew rate. If slew rate exceeds 4V/ns, functionality is uncertain. For 335, slew rates must be  $\geq 0.5$  V/ns.
28.  $V_{CC}$  must not vary more than 4 percent if  $CKE$  is not active while any bank is active.
29. The clock is allowed up to  $\pm 150$ ps of jitter. Each timing parameter is allowed to vary by the same amount.
30.  $t_{HP}$  min is the lesser of  $t_{CL}$  minimum and  $t_{CH}$  minimum actually applied to the device CK and CK# inputs, collectively during bank active.
31. READs and WRITEs with auto precharge are not allowed to be issued until  $t_{RAS}$ (MIN) can be satisfied prior to the internal precharge command being issued.
32. Any positive glitch must be less than 1/3 of the clock and not more than +400mV or 2.9V, whichever is less. Any negative glitch must be less than 1/3 of the clock cycle and not exceed either -300mV or 2.2V, whichever is more positive.

33. Normal Output Drive Curves:
- The full variation in driver pull-down current from minimum to maximum process, temperature and voltage will lie within the outer bounding lines of the V-I curve of Figure 9, Pull-Down Characteristics.
  - The variation in driver pull-down current within nominal limits of voltage and temperature is expected, but not guaranteed, to lie within the inner bounding lines of the V-I curve of Figure 9, Pull-Down Characteristics.
  - The full variation in driver pull-up current from minimum to maximum process, temperature and voltage will lie within the outer bounding lines of the V-I curve of Figure 10, Pull-Up Characteristics.
  - The variation in driver pull-up current within nominal limits of voltage and temperature is expected, but not guaranteed, to lie within the inner bounding lines of the V-I curve of Figure 10, Pull-Up Characteristics.
  - The full variation in the ratio of the maximum to minimum pull-up and pull-down current should be between 0.71 and 1.4, for device drain-to-source voltages from 0.1V to 1.0V, and at the same voltage and temperature.
  - The full variation in the ratio of the nominal pull-up to pull-down current should be unity  $\pm 10$  percent, for device drain-to-source voltages from 0.1V to 1.0V.
34. The voltage levels used are derived from a minimum  $V_{CC}$  level and the referenced test load. In practice, the voltage levels obtained from a properly terminated bus will provide significantly different voltage values.
35.  $V_{IH}$  overshoot:  $V_{IH} (MAX) = V_{CCQ} + 1.5V$  for a pulse width  $\leq 3ns$  and the pulse width can not be greater than 1/3 of the cycle rate.  $V_{IL}$  undershoot:  $V_{IL} (MIN) = -1.5V$  for a pulse width  $\leq 3ns$  and the pulse width can not be greater than 1/3 of the cycle rate.
36.  $V_{CC}$  and  $V_{CCQ}$  must track each other.
37.  $t_{HZ} (MAX)$  will prevail over  $t_{DQCK} (MAX) + t_{RPST} (MAX)$  condition.  $t_{LZ} (MIN)$  will prevail over  $t_{DQCK} (MIN) + t_{RPRE} (MAX)$  condition.
38.  $t_{RPST}$  end point and  $t_{RPRE}$  begin point are not referenced to a specific voltage level but specify when the device output is no longer driving ( $t_{RPST}$ ), or begins driving ( $t_{RPRE}$ ).
39. During Initialization,  $V_{CCQ}$ ,  $V_{TT}$ , and  $V_{REF}$  must be equal to or less than  $V_{CC} + 0.3V$ . Alternatively,  $V_{TT}$  may be 1.35V maximum during power up, even if  $V_{CC}/V_{CCQ}$  are 0.0V, provided a minimum of 42  $\Omega$  of series resistance is used between the  $V_{TT}$  supply and the input pin.
40. The current part operates below the slowest JEDEC operating frequency of 83 MHz. As such, future die may not reflect this option.
41. Random addressing changing and 50 percent of data changing at every transfer.
42. Random addressing changing and 100 percent of data changing at every transfer.
43. CKE must be active (high) during the entire time a refresh command is executed. That is, from the time the AUTO REFRESH command is registered, CKE must be active at each rising clock edge, until  $t_{REF}$  later.
44.  $I_{DD2N}$  specifies the DQ, DQS, and DM to be driven to a valid high or low logic level.  $I_{DD2Q}$  is similar to  $I_{DD2F}$  except  $I_{DD2Q}$  specifies the address and control inputs to remain stable. Although  $I_{DD2F}$ ,  $I_{DD2N}$ , and  $I_{DD2Q}$  are similar,  $I_{DD2F}$  is "worst case."
45. Whenever the operating frequency is altered, not including jitter, the DLL is required to be reset. This is followed by 200 clock cycles.
46. Leakage number reflects the worst case leakage possible through the module pin, not what each memory device contributes.
47. When an input signal is HIGH or LOW, it is defined as a steady state logic HIGH or LOW.
48. The 335 speed grade will operate with  $t_{RAS} (MIN) = 40ns$  and  $t_{RAS} (MAX) = 120,000ns$  at any slower frequency.

### ORDERING INFORMATION FOR AD4

Part Number	Speed	CAS Latency	t <sub>RCD</sub>	t <sub>RP</sub>	Height*
W3EG6433S335AD4	166MHz/333Mb/s	2.5	3	3	35.05 (1.38")
W3EG6433S262AD4	133MHz/266Mb/s	2	2	2	35.05 (1.38")
W3EG6433S265AD4	133MHz/266Mb/s	2.5	3	3	35.05 (1.38")
W3EG6433S202AD4	100MHz/200Mb/s	2	2	2	35.05 (1.38")

- NOTES:
- Consult Factory for availability of Lead-Free or RoHS products. (F = Lead-Free, G = RoHS Compliant)
  - Vendor specific part numbers are used to provide memory components source control. The place holder for this is shown as lower case "x" in the part numbers above and is to be replaced with the respective vendors code. Consult factory for qualified sourcing options. (M = Micron, S = Samsung & consult factory for others)
  - Consult factory for availability of industrial temperature (-40°C to 85°C) option
