

TIL5942, TIL5942A

CURRENT-MODE-PWM CONTROLLER

WITH OPTOISOLATED VOLTAGE REFERENCE AND ERROR AMPLIFIER

SOES040 – OCTOBER 1997

- TL1431, Optocoupler, and Advanced Current-Mode-PWM in a 16-Pin DIP
- LinBiCMOS™ Current-Mode-PWM Operates at Frequencies up to 1 MHz
- 100-μA Maximum Start-up Current
- 2-A, 30-ns MOSFET Drive Output
- TL1431 Voltage Reference/Feedback Amplifier
- 7500-V Peak Withstand Voltage
- Available With Gull Wing VDE Lead Forms
- –40°C to 100°C Free-Air Operating Temperature Range
- Safety Regulatory Approvals Pending
 - UL . . . File Number E65085
 - FIMKO, SEMKO, NEMKO, DEMKO
 - EN60065/IEC 65
 - EN60950/IEC 950
 - VDE 0884, Level 4 (6000-V Insulation)

description

The TIL5942 and TIL5942A consist of an advanced current-mode-PWM controller and a TL1431 adjustable precision shunt regulator, incorporated in a single package. The controller provides a photodetector, an improved MOSFET drive output, and an LED for isolation. The TL1431 is configured as a precision reference/error amplifier. Using the TIL5942 or the TIL5942A, the power-supply designer can implement the controller for an isolated dc/dc converter or off-line switching power supply, with one IC and a few passive components. The TIL5942 standard version has a reference voltage tolerance of 0.8% and the TIL5942A has a reference voltage tolerance of 0.4%.

These controllers are available in a 16-pin PDIP with a lead form for through-hole, or gull-wing lead form for surface-mount applications. These devices operate over a –40°C to 100°C junction temperature range.

End equipment applications for the TIL5942 and the TIL5942A include isolated ac-to-dc power supplies and dc/dc converters.

AVAILABLE OPTIONS

T _A	PACKAGED DEVICES	
	PLASTIC DUAL-IN-LINE WITH VDE LEAD FORM, THROUGH-HOLE	PLASTIC DUAL-IN-LINE WITH VDE LEAD FORM, SURFACE-MOUNT LEADS
–40°C to 100°C	TIL5942NFC, TIL5942ANFC	TIL5942NFD, TIL5942ANFD

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

LinBiCMOS is a trademark of Texas Instruments Incorporated.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

CURRENT-MODE-PWM CONTROLLER

WITH OPTOISOLATED VOLTAGE REFERENCE AND ERROR AMPLIFIER

SOES040 – OCTOBER 1997

functional block diagram

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
FB	1	I	Feedback. FB is an error-amplifier inverting input.
INPUT_GND	2	I	Ground connection for the voltage reference/error amplifier section.
COMP	3	O	Error amplifier output/LED cathode connection. RC networks may be connected between COMP, FB, and GND to stabilize the control loop of the dc/dc converter.
BIAS	4	I	Optocoupler LED anode. BIAS connects to the output voltage of the dc/dc converter or to some other suitable supply voltage through a resistor.
NC	7,8		No connection.
OUT	9	O	Drive output. OUT is a pulse-width-modulated output.
REG	10	O	Regulator output. A 0.1-μF, typical, ceramic capacitor should be connected between REG and PWM_GND.
VCC	11	I	Supply voltage for PWM controller
REF	12	O	PWM 5-V reference output
PWM_GND	13	I	PWM ground connection
RT/CT	14		Connection for external RC network to set PWM oscillator frequency
VC	15		Connection for integrating capacitor (0.1μF typ) to PWM_GND (terminal 13)
IS	16	I	PWM current sense input

theory of operation

The current through the LED is controlled by the precision reference amplifier according to the voltage error at FB, with respect to the internal 2.5-V reference. The light emitted by the LED is coupled to the PWM controller to change the modulation duty cycle and reduce the error voltage.

The PWM controller is in the off state until V_{CC} is greater than the turn-on threshold voltage level. Typically the controller turns on at 16 V. It stays in the on state until the voltage drops below the turn-off threshold of 10 V typical. Upon turning on, the controller generates an internal reference voltage V_{ref} of 5 V, which controls the chip logic and can be used for low-power external applications. A voltage V_{reg} is also generated to supply current to charge an external capacitor C_{reg} , which supplies instant current for the pulsing output.

The oscillator shown in Figure 1 consists of an external resistance-capacitance (RC) network, a voltage comparator, logic, a 125-ns one-shot for the dead time, and a MOSFET used to discharge the external capacitor to ground each cycle. At the end of the reset period, C_T charges toward the 5-V reference through timing resistor R_T for a time given by one time constant $R_T C_T$. The oscillator period is given by:

$$T_{OSC} = R_T C_T + 0.125 \mu s.$$

A current $I_{B(IS)}$ supplied out of IS biases the current-sense resistor on the primary side of the power supply. If the voltage $V_{(IS)}$ at IS exceeds 1 V, the output pulse is reset. An internal current source $I_{(VC)}$ supplies a nominal current of $-4 \mu A$ as a reference. This current charges a capacitor connected between VC and ground. The photodiode is connected internally in parallel with the capacitor. The light-generated photodiode current tends to discharge the capacitor until a steady-state balance is reached. When $I_{(VC)}$ is greater than the photodiode current, a net current is being sourced and the capacitor is charged. When $I_{(VC)}$ is lower than the photodiode current, a net current is being sunk and the capacitor is discharged. When $I_{(VC)}$ is equal to the photodiode current, the capacitor voltage stays constant. The voltage at VC is monitored by an internal comparator with a threshold voltage given by $V_{(IS)} + 2V_d$, where V_d is a diode voltage drop of typically 0.7 V.

Whenever VC is below this threshold, the output pulse is reset. The output pulse is enabled if $V_{(IS)}$ is less than 1 V and VC is greater than its threshold.

The 5-V reference on the PWM chip is brought out on REF and can be used as a reference and/or supply for external circuits as long as the output current is limited to 20 mA and the power dissipation is not exceeded. It is recommended that a 0.1-F ceramic capacitor be connected between REF and PWM_GND.

NOTE A: $t_{osc} = R_T C_T + 0.125 \mu s$

Figure 1. Typical Oscillator Application

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†**LED/REF section**

Supply voltage range, V_{CC} , BIAS to GND	–0.3 V to 37 V
Input current range at FB	–50 μ A to 10 mA
LED forward current	50 mA
Input LED reverse voltage	6 V

PWM section

Supply voltage range, V_{CC}	–0.3 V to 30 V
Input voltage at IS	–0.3 V to 5 V
Continuous supply current, I_{CC}	15 mA

entire package

Isolation voltage	7.5 kV peak or dc (5.3 kVrms)
Total continuous power dissipation	See Dissipation Rating Table
Operating free-air temperature range, T_A	–40°C to 100°C
Storage temperature range, T_{stg}	–55°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

IMPORTANT NOTICE

Texas Instruments (TI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to obtain the latest version of relevant information to verify, before placing orders, that the information being relied on is current.

TI warrants performance of its semiconductor products and related software to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications").

TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS.

Inclusion of TI products in such applications is understood to be fully at the risk of the customer. Use of TI products in such applications requires the written approval of an appropriate TI officer. Questions concerning potential risk applications should be directed to TI through a local SC sales office.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor does TI warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
