

## 2 Mbit (128K x16) 1.8V Asynchronous SRAM

### FEATURES SUMMARY

- SUPPLY VOLTAGE: 1.65 to 1.95V
- 128K x 16 bits SRAM with OUTPUT ENABLE
- EQUAL CYCLE and ACCESS TIME: 55ns
- SINGLE BYTE READ/WRITE
- LOW STANDBY CURRENT
- LOW V<sub>CC</sub> DATA RETENTION: 1.0V
- TRI-STATE COMMON I/O
- AUTOMATIC POWER DOWN

## SUMMARY DESCRIPTION

The M68AR128M is a 2 Mbit (2,097,152 bit) CMOS SRAM, organized as 131,072 words by 16 bits. The device features fully static operation requiring no external clocks or timing strobes, with equal address access and cycle times. It requires a single 1.8V ( $\pm 150\text{mV}$ ) supply. This device has an

automatic power-down feature, reducing the power consumption by over 99% when deselected.

The M68AR128M is available in TFBGA48 (0.75 mm pitch) package.

## OPERATION

The M68AR128M has a Chip Enable power down feature which invokes an automatic standby mode whenever either Chip Enable is de-asserted ( $\overline{E} = \text{High}$ ) or LB and UB are de-asserted (LB and UB = High). An Output Enable ( $\overline{G}$ ) signal provides a high speed tri-state control, allowing fast read/write cycles to be achieved with the common I/O data bus. Operational modes are determined by device control inputs W, E, LB and UB as summarized in the Operating Modes table (see Table 6).

### Read Mode

The M68AR128M is in the Read mode whenever Write Enable (W) is High with Output Enable (G) Low, and Chip Enables (E) is asserted. This provides access to data from eight or sixteen, depending on the status of the signal UB and LB, of the 2,097,152 locations in the static memory array, specified by the 17 address inputs. Valid data will be available at the eight or sixteen output pins within  $t_{AVQV}$  after the last stable address, providing G is Low and E is Low. If Chip Enable or Output Enable access times are not met, data access will be measured from the limiting parameter ( $t_{ELQV}$ ,  $t_{GLQV}$  or  $t_{BLQV}$ ) rather than the address. Data out may be indeterminate at  $t_{ELQX}$ ,  $t_{BLQX}$  and  $t_{GLQX}$ , but data lines will always be valid at  $t_{AVQV}$ .

### Write Mode

The M68AR128M is in the Write mode whenever the W and E are Low. Either the Chip Enable input ( $\overline{E}$ ) or the Write Enable input (W) must be de-asserted during Address transitions for subsequent write cycles. When  $\overline{E}$  (W) is Low, and UB or LB is Low, write cycle begins on the W ( $\overline{E}$ )'s falling edge. When E and W are Low, and UB = LB = High, write cycle begins on the first falling edge of UB or LB. Therefore, address setup time is referenced to Write Enable, Chip Enable or UB/LB as  $t_{AVWL}$ ,  $t_{AVEL}$  and  $t_{AVBL}$  respectively, and is determined by the latter occurring edge.

The Write cycle can be terminated by the earlier rising edge of E, W or UB/LB.

If the Output is enabled ( $\overline{E} = \text{Low}$ ,  $\overline{G} = \text{Low}$ ,  $\overline{LB}$  or  $\overline{UB} = \text{Low}$ ), then W will return the outputs to high impedance within  $t_{WLQZ}$  of its falling edge. Care must be taken to avoid bus contention in this type of operation. Data input must be valid for  $t_{DVWH}$  before the rising edge of Write Enable, or for  $t_{DVEH}$  before the rising edge of E, or for  $t_{DVBH}$  before the rising edge of UB/LB whichever occurs first, and remain valid for  $t_{WHDX}$ ,  $t_{EHDX}$  and  $t_{BHDX}$  respectively.

## MAXIMUM RATING

Stressing the device above the rating listed in the "Absolute Maximum Ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 3. Absolute Maximum Ratings**

Symbol	Parameter	Value	Unit
$I_O^{(1)}$	Output Current	20	mA
$T_A$	Ambient Operating Temperature	-55 to 125	°C
$T_{STG}$	Storage Temperature	-65 to 150	°C
$V_{CC}$	Supply Voltage	-0.5 to 2.5	V
$V_{IO}^{(2)}$	Input or Output Voltage	-0.5 to $V_{CC} + 0.5$	V
$P_D$	Power Dissipation	1	W

Note: 1. One output at a time, not to exceed 1 second duration.

2. Up to a maximum operating  $V_{CC}$  of 1.95V only.

## DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC Characteristic tables are derived from tests performed under the Measure-

ment Conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.
