

Electronic speech circuit having a line fed loudspeaker amplifier and an optional automatic equalization of sending, receiving and sidetone reference equivalent.

T-75-07-15

Technology: Bipolar

Features:

- All functional blocks of a telephone apparatus can be subscriberline fed by an internal stabilized voltage of about 3.5 V DC
- The microphone hybrid transformer is replaced by an electronic circuit
- Built-in loudspeaker amplifier giving 40 mW output power into a 25 Ω speaker
- High performance by the use of dynamic transducers as microphones and earphones. Nonlinear distortion $\leq 1\%$
- High range of line feeding current
- Input resistance independent of line current and sidetone suppression circuit
- Built-in ear protection by earphone voltage limiter
- Optional automatic equalization of sending, receiving and sidetone reference equivalent up to 5 km subscriberline length
- A common transducer (loudspeaker) can be used for loudspeaking and tone ringing (U 450 B) without mechanical switches necessary
- Sending and receiving amplification adjustable
- Minimal line current 8 mA without loudspeaking for proper performance
- High life expectancy due to reduced power consumption of the chip

Case: DIP 18

Circuit description

The electronic speech circuit U 454 B is a linear integrated circuit applicable in telephone and other line fed terminal equipment. It replaces the common speech circuit with carbon microphone, hybrid transformer, sidetone equivalent and ear protection rectifiers.

Two cheap electrodynamic transducers are used as microphone and earphone. The U 454 B contains all components necessary for amplification of signals and adaption to the line.

The circuit is line fed. An integrated amplifier having 40 mW output power allows loudspeaking.

Sending, receiving and sidetone suppression is optionally equalized from DC part of line current in such a way that the influence of a subscriber line loss or mismatch up to 5 km line length is continuously compensated. A stabilized voltage of about 3.5 V which is generated for the loudspeaker amplifier, is usable for further circuits in the set. There is no interaction between the 3.5 V and line voltage peaks or valleys below 3.5 V.

Pin connections and their function description shown in Fig. 2

Pin Symb. Function

- 1 DC Input of DC-part of line current. Voltage drop between Pin 1 and 2 > about 80 mV reduces sending and receiving amplification and sidetone suppression voltage. The threshold for amplification control with resistance $R_5 = 3.16 \Omega$, a line current $I_L > 29$ mA reduces the amplification due to Fig. 10. If the $R_5 = 0$, the amplification can be kept at a high constant value.
The differential resistance is: $13 \Omega + R_5$
- 2 + V Positive line connection
- 3 AF Connection of DC stabilization capacitor C_1 , which determines the inductive part of Z_L
- 4 HT Output of receiver AC voltage reduced by sidetone suppression voltage.
- 5 SV Sending amplifier input (AC current driven), with circuitry for radio noise suppression. R_8 for transmission control:
- $$G_S = \frac{V_2}{V_{9,10}} = 60 \frac{27 Z_L}{R_8} \times \frac{Z_L}{Z_L + Z_{Send}} = 45 \text{ dB}$$
- $R_8 = 3.3 \text{ k}\Omega$, $Z_L = Z_{line} = 780 \Omega$
- 6 N Input from sidetone suppression filter. C_9 coupling capacitor for the antisidetone circuit with R_7 and R_8 in conjunction with C_{10} for high frequencies.
- 7 VM Output of microphone amplifier
- 8 MF Connection of the decoupling capacitor C_8 of microphone amplifier, serves also as an input to small unbalanced input signals. A series resistor will reduce the microphone input amplification
- 9 M_1 Balanced microphone amplifier input
- 10 M_2
- 11 nc not connected
- 12 HE Earphone amplifier input with coupling capacitor C_7
- 13 HA Earphone amplifier output with coupling capacitors for earphone C_6 , and for speaker amplifier C_8 .
- 14 ELH Summing point input of loudspeaker amplifier C_3 coupling capacitor for loudspeaker. C_4 , C_{13} , R_9 , compensation for external output stage and roll off of the speaker amplifier.
- 15 BN Base driver output for external NPN loudspeaker driver-transistor.
- 16 BP Base driver output for external PNP loudspeaker driver-transistor.
- 17 3.5 V Output of internally stabilized DC voltage of about 3.5 V for loudspeaker and other electronic.
- 18 \perp Negative line connection and reference point for measurements. C_{12} acts as the capacitive part of Z_L and suppression of RF reception.
