

To all our customers

Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renesas Technology Corp.

The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.)

Accordingly, although Hitachi, Hitachi, Ltd., Hitachi Semiconductors, and other Hitachi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Cautions

Keep safety first in your circuit designs!

1. Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.
Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors.
Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

Cautions

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.

Preface

The H8S/2600 Series and the H8S/2000 Series are built around an H8S/2000 CPU core.

The H8S/2600 and H8S/2000 CPUs have the same internal 32-bit architecture. Both CPUs execute basic instructions in one state, have sixteen 16-bit registers, and have a concise, optimized instruction set. They can address a 16-Mbyte linear address space. Programs coded in the high-level language C can be compiled to high-speed executable code.

For easy migration, the instruction set is upward-compatible with the H8/300H, H8/300, and H8/300L Series at the object-code level.

The H8S/2600 CPU is upward-compatible with the H8S/2000 CPU at the object-code level, and supports sum of products instructions.

This manual gives details of the H8S/2600 and H8S/2000 instructions and can be used with all microcontrollers in the H8S/2600 Series and the H8S/2000 Series.

For hardware details, refer to the relevant microcontroller hardware manuals.

Main Revisions and Additions in this Edition

Page	Item	Revisions (See Manual for Details)
—	All	Notes on TAS Instruction added Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

1.1 Overview

The H8S/2600 CPU and the H8S/2000 CPU are high-speed central processing units with a common an internal 32-bit architecture. Each CPU is upward-compatible with the H8/300 and H8/300H CPUs. The H8S/2600 CPU and H8S/2000 CPU have sixteen 16-bit general registers, can address a 4-Gbyte linear address space, and are ideal for realtime control.

1.1.1 Features

The H8S/2600 CPU and H8S/2000 CPU have the following features.

- Upward-compatible with H8/300 and H8/300H CPUs
 - Can execute H8/300 and H8/300H object programs
- General-register architecture
 - Sixteen 16-bit general registers (also usable as sixteen 8-bit registers or eight 32-bit registers)
- Sixty-nine basic instructions (H8S/2000 CPU has sixty-five)
 - 8/16/32-bit arithmetic and logic instructions
 - Multiply and divide instructions
 - Powerful bit-manipulation instructions
 - Multiply-and-accumulate instruction (H8S/2600 CPU only)
- Eight addressing modes
 - Register direct [Rn]
 - Register indirect [@ERn]
 - Register indirect with displacement [@(d:16,ERn) or @(d:32,ERn)]
 - Register indirect with post-increment or pre-decrement [@ERn+ or @-ERn]
 - Absolute address [@aa:8, @aa:16, @aa:24, or @aa:32]
 - Immediate [#xx:8, #xx:16, or #xx:32]
 - Program-counter relative [@(d:8,PC) or @(d:16,PC)]
 - Memory indirect [@@aa:8]
- 4-Gbyte address space
 - Program: 16 Mbytes
 - Data: 4 Gbytes

- High-speed operation
 - All frequently-used instructions execute in one or two states
 - Maximum clock frequency: 20 MHz
 - 8/16/32-bit register-register add/subtract: 50 ns
 - 8×8 -bit register-register multiply: 150 ns (H8S/2000 CPU: 600 ns)
 - $16 \div 8$ -bit register-register divide: 600 ns
 - 16×16 -bit register-register multiply: 200 ns (H8S/2000 CPU: 1000 ns)
 - $32 \div 16$ -bit register-register divide: 1000 ns
- Two CPU operating modes
 - Normal mode
 - Advanced mode
- Power-down modes
 - Transition to power-down state by SLEEP instruction
 - CPU clock speed selection

1.1.2 Differences between H8S/2600 CPU and H8S/2000 CPU

Differences between the H8S/2600 CPU and the H8S/2000 CPU are as follows.

- Register configuration
 - The MAC register is supported only by the H8S/2600 CPU.
For details, see section 1.4, Register Configuration.
- Basic instructions
 - The MAC, CLRMAC, LDMAC, and STMAC instructions are supported only by the H8S/2600 CPU.
For details, see section 1.6, Instruction Set, and Section 2, Instruction Descriptions.
- Number of states required for execution
 - The number of states required for execution of the MULXU and MULXS instructions.
For details, see section 2.6, Number of States Required for Execution.

In addition, there may be differences in address spaces, EXR register functions, power-down states, and so on. For details, refer to the relevant microcontroller hardware manual.

1.1.3 Differences from H8/300 CPU

In comparison with the H8/300 CPU, the H8S/2600 CPU and H8S/2000 CPU have the following enhancements.

- More general registers and control registers
 - Eight 16-bit registers, one 8-bit and two 32-bit control registers have been added.
- Expanded address space
 - Normal mode supports the same 64-kbyte address space as the H8/300 CPU.
 - Advanced mode supports a maximum 4-Gbyte address space.
- Enhanced addressing
 - The addressing modes have been enhanced to make effective use of the 4-Gbyte address space.
- Enhanced instructions
 - Addressing modes of bit-manipulation instructions have been enhanced.
 - Signed multiply and divide instructions have been added.
 - A multiply-and-accumulate instruction has been added. (H8S/2600CPU only)
 - Two-bit shift and rotate instructions have been added.
 - Instructions for saving and restoring multiple registers have been added.
 - A test and set instruction has been added.
- Higher speed
 - Basic instructions execute twice as fast.

1.1.4 Differences from H8/300H CPU

In comparison with the H8/300H CPU, the H8S/2600 CPU and H8S/2000 CPU have the following enhancements.

- Additional control register
 - One 8-bit and two 32-bit control registers have been added.
- Expanded address space
 - Advanced mode supports a maximum 4-Gbyte data address space.
- Enhanced instructions
 - Addressing modes of bit-manipulation instructions have been enhanced.
 - A multiply-and-accumulate instruction has been added (H8S/2600 CPU only).
 - Two-bit shift and rotate instructions have been added.
 - Instructions for saving and restoring multiple registers have been added.
 - A test and set instruction has been added.
- Higher speed
 - Basic instructions execute twice as fast.

1.2 CPU Operating Modes

Like the H8/300H CPU, the H8S/2600 CPU has two operating modes: normal and advanced. Normal mode supports a maximum 64-kbyte address space. Advanced mode supports a maximum 4-Gbyte total address space, of which up to 16 Mbytes can be used for program code and up to 4 Gbytes for data. The mode is selected with the mode pins of the microcontroller. For further information, refer to the relevant microcontroller hardware manual.

Figure 1.1 CPU Operating Modes

(1) Normal Mode

The exception vector table and stack have the same structure as in the H8/300 CPU.

Address Space: A maximum address space of 64 kbytes can be accessed, as in the H8/300 CPU.

Extended Registers (En): The extended registers (E0 to E7) can be used as 16-bit registers, or as the upper 16-bit segments of 32-bit registers. When En is used as a 16-bit register it can contain any value, even when the corresponding general register (R0 to R7) is used as an address register. If the general register is referenced in the register indirect addressing mode with pre-decrement (@-Rn) or post-increment (@Rn+) and a carry or borrow occurs, however, the value in the corresponding extended register will be affected.

Instruction Set: All additional instructions and addressing modes not found in the H8/300 CPU can be used. Only the lower 16 bits of effective addresses (EA) are valid.

Exception Vector Table and Memory Indirect Branch Addresses: In normal mode the top area starting at H'0000 is allocated to the exception vector table. One branch address is stored per 16 bits (figure 1.2). The exception vector table differs depending on the microcontroller. Refer to the relevant microcontroller hardware manual for further information.

Figure 1.2 Exception Vector Table (Normal Mode)

The memory indirect addressing mode (@@aa:8) employed in the JMP and JSR instructions uses an 8-bit absolute address included in the instruction code to specify a memory operand that contains a branch address. In normal mode the operand is a 16-bit word operand, providing a 16-bit branch address. Branch addresses can be stored in the top area from H'0000 to H'00FF. Note that this area is also used for the exception vector table.

Stack Structure: When the program counter (PC) is pushed onto the stack in a subroutine call, and the PC, condition-code register (CCR), and extended control register (EXR) are pushed onto the stack in exception handling, they are stored as shown in figure 1.3. When EXR is invalid, it is not pushed onto the stack. For details, see the relevant hardware manual.

Figure 1.3 Stack Structure in Normal Mode

(2) Advanced Mode

In advanced mode the data address space is larger than for the H8/300H CPU.

Address Space: The 4-Gbyte maximum address space provides linear access to a maximum 16 Mbytes of program code and maximum 4 Gbytes of data.

Extended Registers (En): The extended registers (E0 to E7) can be used as 16-bit registers, or as the upper 16-bit segments of 32-bit registers or address registers.

Instruction Set: All instructions and addressing modes can be used.

Exception Vector Table and Memory Indirect Branch Addresses: In advanced mode the top area starting at H'00000000 is allocated to the exception vector table in units of 32 bits. In each 32 bits, the upper 8 bits are ignored and a branch address is stored in the lower 24 bits (figure 1.4). The exception vector table differs depending on the microcontroller. Refer to the relevant microcontroller hardware manual for further information.

Figure 1.4 Exception Vector Table (Advanced Mode)

The memory indirect addressing mode (@@aa:8) employed in the JMP and JSR instructions uses an 8-bit absolute address included in the instruction code to specify a memory operand that contains a branch address. In advanced mode the operand is a 32-bit longword operand, providing a 32-bit branch address. The upper 8 bits of these 32 bits are a reserved area that is regarded as H'00. Branch addresses can be stored in the top area from H'00000000 to H'000000FF. Note that this area is also used for the exception vector table.

Stack Structure: In advanced mode, when the program counter (PC) is pushed onto the stack in a subroutine call, and the PC, condition-code register (CCR), and extended control register (EXR) are pushed onto the stack in exception handling, they are stored as shown in figure 1.5. When EXR is invalid, it is not pushed onto the stack. For details, see the relevant hardware manual.

Figure 1.5 Stack Structure in Advanced Mode

1.3 Address Space

Figure 1.6 shows a memory map of the H8S/2600 CPU. The H8S/2600 CPU provides linear access to a maximum 64-kbyte address space in normal mode, and a maximum 4-Gbyte address space in advanced mode. The address space differs depending on the operating mode. For details, refer to the relevant microcontroller hardware manual.

Figure 1.6 Memory Map

1.4 Register Configuration

1.4.1 Overview

The CPUs have the internal registers shown in figure 1.7. There are two types of registers: general registers and control registers. The H8S/2000 CPU does not support the MAC register.

Figure 1.7 CPU Registers

1.4.2 General Registers

The CPUs have eight 32-bit general registers. These general registers are all functionally alike and can be used as both address registers and data registers. When a general register is used as a data register, it can be accessed as a 32-bit, 16-bit, or 8-bit register. When the general registers are used as 32-bit registers or address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8-bit general registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum sixteen 8-bit registers.

Figure 1.8 illustrates the usage of the general registers. The usage of each register can be selected independently.

Figure 1.8 Usage of General Registers

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 1.9 shows the stack.

Figure 1.9 Stack

1.4.3 Control Registers

The control registers are the 24-bit program counter (PC), 8-bit extended control register (EXR), 8-bit condition-code register (CCR), and 64-bit multiply-accumulate register (MAC: H8S/2600 CPU only).

(1) Program Counter (PC)

This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 16 bits (one word) or a multiple of 16 bits, so the least significant PC bit is ignored. When an instruction is fetched, the least significant PC bit is regarded as 0.

(2) Extended Control Register (EXR)

This 8-bit register contains the trace bit (T) and three interrupt mask bits (I2 to I0).

Bit 7—Trace Bit (T): Selects trace mode. When this bit is cleared to 0, instructions are executed in sequence. When this bit is set to 1, a trace exception is generated each time an instruction is executed.

Bits 6 to 3—Reserved: These bits are reserved, always read as 1.

Bits 2 to 0—Interrupt Mask Bits (I2 to I0): These bits designate the interrupt mask level (0 to 7). For details refer to the relevant microcontroller hardware manual.

Operations can be performed on the EXR bits by the LDC, STC, ANDC, ORC, and XORC instructions. All interrupts, including NMI, are disabled for three states after one of these instructions is executed, except for STC.

(3) Condition-Code Register (CCR)

This 8-bit register contains internal CPU status information, including an interrupt mask bit (I) and half-carry (H), negative (N), zero (Z), overflow (V), and carry (C) flags.

Bit 7—Interrupt Mask Bit (I): Masks interrupts other than NMI when set to 1. (NMI is accepted regardless of the I bit setting.) The I bit is set to 1 by hardware at the start of an exception-handling sequence.

Bit 6—User Bit or Interrupt Mask Bit (UI): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. This bit can also be used as an interrupt mask bit. For details refer to the relevant microcontroller hardware manual.

Bit 5—Half-Carry Flag (H): When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3, and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 11, and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise.

Bit 4—User Bit (U): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions.

Bit 3—Negative Flag (N): Stores the value of the most significant bit (sign bit) of data.

Bit 2—Zero Flag (Z): Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data.

Bit 1—Overflow Flag (V): Set to 1 when an arithmetic overflow occurs, and cleared to 0 at other times.

Bit 0—Carry Flag (C): Set to 1 when a carry occurs, and cleared to 0 otherwise. Used by:

- Add instructions, to indicate a carry
- Subtract instructions, to indicate a borrow
- Shift and rotate instructions, to store the value shifted out of the end bit

The carry flag is also used as a bit accumulator by bit manipulation instructions.

Some instructions leave some or all of the flag bits unchanged. For the action of each instruction on the flag bits, refer to the detailed descriptions of the instructions starting in section 2.2.1.

Operations can be performed on the CCR bits by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used as branching conditions for conditional branch (Bcc) instructions.

(4) Multiply-Accumulate Register (MAC)

The MAC register is supported only by the H8S/2600 CPU. This 64-bit register stores the results of multiply-and-accumulate operations. It consists of two 32-bit registers denoted MACH and MACL. The lower 10 bits of MACH are valid; the upper bits are a sign extension.

1.4.4 Initial Register Values

Reset exception handling loads the CPU's program counter (PC) from the vector table, clears the trace bit in EXR to 0, and sets the interrupt mask bits in CCR and EXR to 1. The other CCR bits and the general registers are not initialized. In particular, the stack pointer (ER7) is not initialized. The stack pointer should therefore be initialized by an MOV.L instruction executed immediately after a reset.

1.5 Data Formats

The CPUs can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1-bit data by accessing bit n ($n = 0, 1, 2, \dots, 7$) of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit BCD data.

1.5.1 General Register Data Formats

Figure 1.10 shows the data formats in general registers.

Data Type	Register Number	Data Format
1-bit data	RnH	
1-bit data	RnL	
4-bit BCD data	RnH	
4-bit BCD data	RnL	
Byte data	RnH	
Byte data	RnL	

Figure 1.10 General Register Data Formats

Legend

ERn: General register ER
 En: General register E
 Rn: General register R
 RnH: General register RH
 RnL: General register RL
 MSB: Most significant bit
 LSB: Least significant bit

Figure 1.10 General Register Data Formats (cont)

1.5.2 Memory Data Formats

Figure 1.11 shows the data formats in memory. The CPU can access word data and longword data in memory, but word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, no address error occurs but the least significant bit of the address is regarded as 0, so the access starts at the preceding address. This also applies to instruction fetches.

Figure 1.11 Memory Data Formats

When the stack pointer (ER7) is used as an address register to access the stack, the operand size should be word size or longword size.

1.6 Instruction Set

1.6.1 Overview

The H8S/2600 CPU has 69 types of instructions, while the H8S/2000 CPU has 65 types. The instructions are classified by function as shown in table 1.1. For a detailed description of each instruction, see section 2.2, Instruction Descriptions.

Table 1.1 Instruction Classification

Function	Instructions	Size	Types
Data transfer	MOV	BWL	5
	POP* ² , PUSH* ²	WL	
	LDM, STM	L	
	MOVFPE, MOVTPE	B	
Arithmetic operations	ADD, SUB, CMP, NEG	BWL	19
	ADDX, SUBX, DAA, DAS	B	
	INC, DEC	BWL	
	ADDS, SUBS	L	
	MULXU, DIVXU, MULXS, DIVXS	BW	
	EXTU, EXTS	WL	
	TAS* ⁴	B	
	MAC, LDMAC, STMAC, CLRMAC* ¹	—	
Logic operations	AND, OR, XOR, NOT	BWL	4
Shift	SHAL, SHAR, SHLL, SHLR, ROTL, ROTR, ROTXL, ROTXR	BWL	8
Bit manipulation	BSET, BCLR, BNOT, BTST, BLD, BILD, BST, BIST, BAND, BIAN, BOR, BIOR, BXOR, BIXOR	B	14
Branch	Bcc* ³ , JMP, BSR, JSR, RTS	—	5
System control	TRAPA, RTE, SLEEP, LDC, STC, ANDC, ORC, XORC, NOP	—	9
Block data transfer	EEPMOV	—	1

H8S/2600 CPU: Total 69 types

H8S/2000 CPU: Total 65 types

Notes: B—byte size; W—word size; L—longword size.

1. The MAC, LDMAC, STMAC, and CLRMAC instructions are supported only by the H8S/2600 CPU.
2. POP.W Rn and PUSH.W Rn are identical to MOV.W @SP+, Rn and MOV.W Rn, @-SP. POP.L ERn and PUSH.L ERn are identical to MOV.L @SP+, ERn and MOV.L ERn, @-SP.
3. Bcc is the generic designation of a conditional branch instruction.
4. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

1.6.2 Instructions and Addressing Modes

Table 1.2 indicates the combinations of instructions and addressing modes that the H8S/2600 CPU and H8S/2000 CPU can use.

Table 1.2 Combinations of Instructions and Addressing Modes

Function	Instruction	Addressing Modes												#xx	Rn	@ERn	@(d:16,ERn)	@(d:32,ERn)	@-ERn/@ERn+	@aa:8	@aa:16	@aa:24	@aa:32	@(d:8,PC)	@(d:16,PC)	@aa:8	—

1.6.3 Table of Instructions Classified by Function

Table 1.3 summarizes the instructions in each functional category. The notation used in table 1.3 is defined next.

Operation Notation

Rd	General register (destination)*
Rs	General register (source)*
Rn	General register*
ERn	General register (32-bit register)
MAC	Multiply-accumulate register (32-bit register)
(EAd)	Destination operand
(EAs)	Source operand
EXR	Extended control register
CCR	Condition-code register
N	N (negative) flag in CCR
Z	Z (zero) flag in CCR
V	V (overflow) flag in CCR
C	C (carry) flag in CCR
PC	Program counter
SP	Stack pointer
#IMM	Immediate data
disp	Displacement
+	Addition
−	Subtraction
×	Multiplication
÷	Division
^	Logical AND
∨	Logical OR
⊕	Logical exclusive OR
→	Move
¬	Logical not (logical complement)
:8/:16/:24/:32	8-, 16-, 24-, or 32-bit length

Note: * General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit registers (ER0 to ER7).

Table 1.3 Instructions Classified by Function

Type	Instruction	Size* ¹	Function
Data transfer	MOV	B/W/L	(EAs) → Rd, Rs → (EAd) Moves data between two general registers or between a general register and memory, or moves immediate data to a general register.
	MOVFPE	B	(EAs) → Rd Moves external memory contents (addressed by @aa:16) to a general register in synchronization with an E clock.
	MOVTPE	B	Rs → (EAs) Moves general register contents to an external memory location (addressed by @aa:16) in synchronization with an E clock.
	POP	W/L	@SP+ → Rn Pops a register from the stack. POP.W Rn is identical to MOV.W @SP+, Rn. POP.L ERn is identical to MOV.L @SP+, ERn.
	PUSH	W/L	Rn → @-SP Pushes a register onto the stack. PUSH.W Rn is identical to MOV.W Rn, @-SP. PUSH.L ERn is identical to MOV.L ERn, @-SP.
	LDM	L	@SP+ → Rn (register list) Pops two or more general registers from the stack.
	STM	L	Rn (register list) → @-SP Pushes two or more general registers onto the stack.

Type	Instruction	Size* ¹	Function
Arithmetic operations	ADD	B/W/L	$Rd \pm Rs \rightarrow Rd$, $Rd \pm \#IMM \rightarrow Rd$
	SUB		Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register. (Immediate byte data cannot be subtracted from byte data in a general register. Use the SUBX or ADD instruction.)
	ADDX	B	$Rd \pm Rs \pm C \rightarrow Rd$, $Rd \pm \#IMM \pm C \rightarrow Rd$
	SUBX		Performs addition or subtraction with carry or borrow on byte data in two general registers, or on immediate data and data in a general register.
	INC	B/W/L	$Rd \pm 1 \rightarrow Rd$, $Rd \pm 2 \rightarrow Rd$
	DEC		Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.)
	ADDS	L	$Rd \pm 1 \rightarrow Rd$, $Rd \pm 2 \rightarrow Rd$, $Rd \pm 4 \rightarrow Rd$
	SUBS		Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register.
	DAA	B	Rd decimal adjust $\rightarrow Rd$
	DAS		Decimal-adjusts an addition or subtraction result in a general register by referring to the CCR to produce 4-bit BCD data.
	MULXU	B/W	$Rd \times Rs \rightarrow Rd$ Performs unsigned multiplication on data in two general registers: either 8 bits $\times$ 8 bits $\rightarrow$ 16 bits or 16 bits $\times$ 16 bits $\rightarrow$ 32 bits.
	MULXS	B/W	$Rd \times Rs \rightarrow Rd$ Performs signed multiplication on data in two general registers: either 8 bits $\times$ 8 bits $\rightarrow$ 16 bits or 16 bits $\times$ 16 bits $\rightarrow$ 32 bits.
	DIVXU	B/W	$Rd \div Rs \rightarrow Rd$ Performs unsigned division on data in two general registers: either 16 bits $\div$ 8 bits $\rightarrow$ 8-bit quotient and 8-bit remainder or 32 bits $\div$ 16 bits $\rightarrow$ 16-bit quotient and 16-bit remainder.
	DIVXS	B/W	$Rd \div Rs \rightarrow Rd$ Performs signed division on data in two general registers: either 16 bits $\div$ 8 bits $\rightarrow$ 8-bit quotient and 8-bit remainder or 32 bits $\div$ 16 bits $\rightarrow$ 16-bit quotient and 16-bit remainder.

Type	Instruction	Size* ¹	Function
Arithmetic operations	CMP	B/W/L	$Rd - Rs, Rd - \#IMM$ Compares data in a general register with data in another general register or with immediate data, and sets CCR bits according to the result.
	NEG	B/W/L	$0 - Rd \rightarrow Rd$ Takes the two's complement (arithmetic complement) of data in a general register.
	EXTU	W/L	$Rd \text{ (zero extension)} \rightarrow Rd$ Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 bits of a 32-bit register to longword size, by padding with zeros on the left.
	EXTS	W/L	$Rd \text{ (sign extension)} \rightarrow Rd$ Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 bits of a 32-bit register to longword size, by extending the sign bit.
	TAS	B	$@ERd - 0, 1 \rightarrow (<\text{bit } 7> \text{ of } @ERd)^{*2}$ Tests memory contents, and sets the most significant bit (bit 7) to 1.
	MAC	—	$(EAs) \times (EAd) + MAC \rightarrow MAC$ Performs signed multiplication on memory contents and adds the result to the multiply-accumulate register. The following operations can be performed: 16 bits $\times$ 16 bits + 32 bits $\rightarrow$ 32 bits, saturating 16 bits $\times$ 16 bits + 42 bits $\rightarrow$ 42 bits, non-saturating Supported by H8S/2600 CPU only.
	CLRMAC	—	$0 \rightarrow MAC$ Clears the multiply-accumulate register to zero. Supported by H8S/2600 CPU only.
	LDMAC	L	$Rs \rightarrow MAC, MAC \rightarrow Rd$
	STMAC		Transfers data between a general register and the multiply-accumulate register. Supported by H8S/2600 CPU only.

Type	Instruction	Size* ¹	Function
Logic operations	AND	B/W/L	$Rd \wedge Rs \rightarrow Rd$, $Rd \wedge \#IMM \rightarrow Rd$ Performs a logical AND operation on a general register and another general register or immediate data.
	OR	B/W/L	$Rd \vee Rs \rightarrow Rd$, $Rd \vee \#IMM \rightarrow Rd$ Performs a logical OR operation on a general register and another general register or immediate data.
	XOR	B/W/L	$Rd \oplus Rs \rightarrow Rd$, $Rd \oplus \#IMM \rightarrow Rd$ Performs a logical exclusive OR operation on a general register and another general register or immediate data.
	NOT	B/W/L	$\neg (Rd) \rightarrow (Rd)$ Takes the one's complement of general register contents.
Shift operations	SHAL SHAR	B/W/L	$Rd \text{ (shift)} \rightarrow Rd$ Performs an arithmetic shift on general register contents. 1-bit or 2-bit shift is possible.
	SHLL SHLR	B/W/L	$Rd \text{ (shift)} \rightarrow Rd$ Performs a logical shift on general register contents. 1-bit or 2-bit shift is possible.
	ROTL ROTR	B/W/L	$Rd \text{ (rotate)} \rightarrow Rd$ Rotates general register contents. 1-bit or 2-bit rotation is possible.
	ROTXL ROTXR	B/W/L	$Rd \text{ (rotate)} \rightarrow Rd$ Rotates general register contents through the carry bit. 1-bit or 2-bit rotation is possible.

Type	Instruction	Size* ¹	Function
Bit-manipulation instructions	BSET	B	$1 \rightarrow (\text{<bit-No.> of <EAd>})$ Sets a specified bit in a general register or memory operand to 1. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.
	BCLR	B	$0 \rightarrow (\text{<bit-No.> of <EAd>})$ Clears a specified bit in a general register or memory operand to 0. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.
	BNOT	B	$\neg (\text{<bit-No.> of <EAd>}) \rightarrow (\text{<bit-No.> of <EAd>})$ Inverts a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.
	BTST	B	$\neg (\text{<bit-No.> of <EAd>}) \rightarrow Z$ Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.
	BAND	B	$C \wedge (\text{<bit-No.> of <EAd>}) \rightarrow C$ ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
	BIAND	B	$C \wedge \neg (\text{<bit-No.> of <EAd>}) \rightarrow C$ ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
	BOR	B	$C \vee (\text{<bit-No.> of <EAd>}) \rightarrow C$ ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
	BIOR	B	$C \vee \neg (\text{<bit-No.> of <EAd>}) \rightarrow C$ ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.

Type	Instruction	Size* ¹	Function
Bit-manipulation instructions	BXOR	B	$C \oplus (<\text{bit-No.}> \text{ of } <\text{EAd}>) \rightarrow C$ Exclusive-ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
	BIXOR	B	$C \oplus \neg (<\text{bit-No.}> \text{ of } <\text{EAd}>) \rightarrow C$ Exclusive-ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
	BLD	B	$(<\text{bit-No.}> \text{ of } <\text{EAd}>) \rightarrow C$ Transfers a specified bit in a general register or memory operand to the carry flag.
	BILD	B	$\neg (<\text{bit-No.}> \text{ of } <\text{EAd}>) \rightarrow C$ Transfers the inverse of a specified bit in a general register or memory operand to the carry flag. The bit number is specified by 3-bit immediate data.
	BST	B	$C \rightarrow (<\text{bit-No.}> \text{ of } <\text{EAd}>)$ Transfers the carry flag value to a specified bit in a general register or memory operand.
	BIST	B	$\neg C \rightarrow (<\text{bit-No.}> \text{ of } <\text{EAd}>)$ Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data.

			BHI	High	$C \vee Z = 0$																																																	
			BLS	Low or same	$C \vee Z = 1$																																																	
			BCC(BHS)	Carry clear (high or same)	$C = 0$																																																	
			BCS(BLO)	Carry set (low)	$C = 1$																																																	
			BNE	Not equal	$Z = 0$																																																	
			BEQ	Equal	$Z = 1$																																																	
			BVC	Overflow clear	$V = 0$																																																	
			BVS	Overflow set	$V = 1$																																																	
			BPL	Plus	$N = 0$																																																	
			BMI	Minus	$N = 1$																																																	
			BGE	Greater or equal	$N \oplus V = 0$																																																	
			BLT	Less than	$N \oplus V = 1$																																																	
			BGT	Greater than	$Z \vee (N \oplus V) = 0$																																																	
			BLE	Less or equal	$Z \vee (N \oplus V) = 1$																																																	
			JMP	—	Branches unconditionally to a specified address.																																																	
BSR	—	Branches to a subroutine at a specified address.																																																				
JSR	—	Branches to a subroutine at a specified address.																																																				
RTS	—	Returns from a subroutine																																																				

Type	Instruction	Size* ¹	Function
System control instructions	TRAPA	—	Starts trap-instruction exception handling.
	RTE	—	Returns from an exception-handling routine.
	SLEEP	—	Causes a transition to a power-down state.
	LDC	B/W	(EAs) → CCR, (EAs) → EXR Moves the source operand contents or immediate data to CCR or EXR. Although CCR and EXR are 8-bit registers, word-size transfers are performed between them and memory. The upper 8 bits are valid.
	STC	B/W	CCR → (EAd), EXR → (EAd) Transfers CCR or EXR contents to a general register or memory. Although CCR and EXR are 8-bit registers, word-size transfers are performed between them and memory. The upper 8 bits are valid.
	ANDC	B	CCR ∧ #IMM → CCR, EXR ∧ #IMM → EXR Logically ANDs the CCR or EXR contents with immediate data.
	ORC	B	CCR ∨ #IMM → CCR, EXR ∨ #IMM → EXR Logically ORs the CCR or EXR contents with immediate data.
	XORC	B	CCR ⊕ #IMM → CCR, EXR ⊕ #IMM → EXR Logically exclusive-ORs the CCR or EXR contents with immediate data.
	NOP	—	PC + 2 → PC Only increments the program counter.

Type	Instruction	Size* ¹	Function
Block data transfer instruction	EEPMOV.B	—	if R4L $\neq$ 0 then Repeat @ER5+ $\rightarrow$ @ER6+ R4L – 1 $\rightarrow$ R4L Until R4L = 0 else next;
	EEPMOV.W	—	if R4 $\neq$ 0 then Repeat @ER5+ $\rightarrow$ @ER6+ R4 – 1 $\rightarrow$ R4 Until R4 = 0 else next; Transfers a data block according to parameters set in general registers R4L or R4, ER5, and ER6. R4L or R4: size of block (bytes) ER5: starting source address ER6: starting destination address Execution of the next instruction begins as soon as the transfer is completed.

Notes: 1. Size refers to the operand size.

B: Byte

W: Word

L: Longword

2. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

1.6.4 Basic Instruction Formats

The H8S/2600 or H8S/2000 instructions consist of 2-byte (1-word) units. An instruction consists of an operation field (op field), a register field (r field), an effective address extension (EA field), and a condition field (cc).

Operation Field: Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first four bits of the instruction. Some instructions have two operation fields.

Register Field: Specifies a general register. Address registers are specified by 3 bits, data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.

Effective Address Extension: Eight, 16, or 32 bits specifying immediate data, an absolute address, or a displacement.

Condition Field: Specifies the branching condition of Bcc instructions.

Figure 1.12 shows examples of instruction formats.

Figure 1.12 Instruction Formats

1.7 Addressing Modes and Effective Address Calculation

(1) Addressing Modes

The CPUs support the eight addressing modes listed in table 1.4. Each instruction uses a subset of these addressing modes. Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit manipulation instructions use register direct, register indirect, or absolute addressing mode to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

Table 1.4 Addressing Modes

No.	Addressing Mode	Symbol
1	Register direct	Rn
2	Register indirect	@ERn
3	Register indirect with displacement	@(d:16,ERn)/@(d:32,ERn)
4	Register indirect with post-increment	@ERn+
	Register indirect with pre-decrement	@-ERn
5	Absolute address	@aa:8/@aa:16/@aa:24/@aa:32
6	Immediate	#xx:8/#xx:16/#xx:32
7	Program-counter relative	@(d:8,PC)/@(d:16,PC)
8	Memory indirect	@@aa:8

1. Register Direct—Rn: The register field of the instruction specifies an 8-, 16-, or 32-bit general register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16-bit registers. ER0 to ER7 can be specified as 32-bit registers.

2. Register Indirect—@ERn: The register field of the instruction code specifies an address register (ERn) which contains the address of the operand in memory. If the address is a program instruction address, the lower 24 bits are valid and the upper 8 bits are all assumed to be 0 (H'00).

3. Register Indirect with Displacement—@(d:16, ERn) or @(d:32, ERn): A 16-bit or 32-bit displacement contained in the instruction is added to an address register (ERn) specified by the register field of the instruction, and the sum gives the address of a memory operand. A 16-bit displacement is sign-extended when added.

4. Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @-ERn:

- Register indirect with post-increment—@ERn+

The register field of the instruction code specifies an address register (ERn) which contains the address of a memory operand. After the operand is accessed, 1, 2, or 4 is added to the address register contents and the sum is stored in the address register. The value added is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the register value should be even.

- Register indirect with pre-decrement—@-ERn

The value 1, 2, or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the result becomes the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the register value should be even.

5. Absolute Address—@aa:8, @aa:16, @aa:24, or @aa:32: The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long (@aa:8), 16 bits long (@aa:16), 24 bits long (@aa:24), or 32 bits long (@aa:32).

To access data, the absolute address should be 8 bits (@aa:8), 16 bits (@aa:16), or 32 bits (@aa:32) long. For an 8-bit absolute address, the upper 24 bits are all assumed to be 1 (H'FFFFFF). For a 16-bit absolute address the upper 16 bits are a sign extension. A 32-bit absolute address can access the entire address space.

A 24-bit absolute address (@aa:24) indicates the address of a program instruction. The upper 8 bits are all assumed to be 0 (H'00).

Table 1.5 indicates the accessible absolute address ranges.

Table 1.5 Absolute Address Access Ranges

Absolute Address		Normal Mode	Advanced Mode
Data address	8 bits (@aa:8)	H'FF00 to H'FFFF	H'FFFFFFF00 to H'FFFFFFF
	16 bits (@aa:16)	H'0000 to H'FFFF	H'00000000 to H'00007FFF, H'FFFF8000 to H'FFFFFFF
	32 bits (@aa:32)		H'00000000 to H'FFFFFFF
Program instruction address	24 bits (@aa:24)		H'00000000 to H'00FFFFFF

For further details on the accessible range, refer to the relevant microcontroller hardware manual.

6. Immediate—#xx:8, #xx:16, or #xx:32: The instruction contains 8-bit (#xx:8), 16-bit (#xx:16), or 32-bit (#xx:32) immediate data as an operand.

The ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. Some bit manipulation instructions contain 3-bit immediate data in the instruction code, specifying a bit number. The TRAPA instruction contains 2-bit immediate data in its instruction code, specifying a vector address.

7. Program-Counter Relative—@(d:8, PC) or @(d:16, PC): This mode is used in the Bcc and BSR instructions. An 8-bit or 16-bit displacement contained in the instruction is sign-extended and added to the 24-bit PC contents to generate a branch address. Only the lower 24 bits of this branch address are valid; the upper 8 bits are all assumed to be 0 (H'00). The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is –126 to +128 bytes (–63 to +64 words) or –32766 to +32768 bytes (–16383 to +16384 words) from the branch instruction. The resulting value should be an even number.

8. Memory Indirect—@@aa:8: This mode can be used by the JMP and JSR instructions. The second byte of the instruction specifies a memory operand by an 8-bit absolute address. This memory operand contains a branch address. The upper bits of the absolute address are all assumed to be 0, so the address range is 0 to 255 (H'0000 to H'00FF in normal mode, H'00000000 to H'000000FF in advanced mode). In normal mode the memory operand is a word operand and the branch address is 16 bits long. In advanced mode the memory operand is a longword operand, the first byte of which is assumed to be all 0 (H'00).

Note that the first part of the address range is also the exception vector area. For further details refer to the relevant microcontroller hardware manual.

Figure 1.13 Branch Address Specification in Memory Indirect Mode

If an odd address is specified in word or longword memory access, or as a branch address, the least significant bit is regarded as 0, causing data to be accessed or an instruction code to be fetched at the address preceding the specified address. (For further information, see section 1.5.2, Memory Data Formats.)

(2) Effective Address Calculation

Table 1.6 indicates how effective addresses are calculated in each addressing mode. In normal mode the upper 8 bits of the effective address are ignored in order to generate a 16-bit address.

Table 1.6 Effective Address Calculation

No.	Addressing Mode and Instruction Format	Effective Address Calculation	Effective Address (EA)				
1	Register direct (Rn) <table><tr><td>op</td><td>rm</td><td>rn</td></tr></table>	op	rm	rn		Operand is general register contents.

Section 2 Instruction Descriptions

2.1 Tables and Symbols

This section explains how to read the tables in section 2.2, describing each instruction. Note that the descriptions of some instructions extend over more than one page.

[1] Mnemonic (Full Name)	[2] Type
[3] Operation	[6] Condition Code
[4] Assembly-Language Format	
[5] Operand Size	
[7] Description	
[8] Available Registers	
[9] Operand Format and Number of States Required for Execution	
[10] Notes	

- [1] **Mnemonic (Full Name):** Gives the full and mnemonic names of the instruction.
- [2] **Type:** Indicates the type of instruction.
- [3] **Operation:** Describes the instruction in symbolic notation. (See section 2.1.2, Operation.)
- [4] **Assembly-Language Format:** Indicates the assembly-language format of the instruction. (See section 2.1.1, Assembler Format.)
- [5] **Operand Size:** Indicates the available operand sizes.
- [6] **Condition Code:** Indicates the effect of instruction execution on the flag bits in the CCR. (See section 2.1.3, Condition Code.)
- [7] **Description:** Describes the operation of the instruction in detail.
- [8] **Available Registers:** Indicates which registers can be specified in the register field of the instruction.
- [9] **Operand Format and Number of States Required for Execution:** Shows the addressing modes and instruction format together with the number of states required for execution.
- [10] **Notes:** Gives notes concerning execution of the instruction.

2.1.1 Assembly-Language Format

The operand size is byte (B), word (W), or longword (L). Some instructions are restricted to a limited set of operand sizes.

The symbol <EA> indicates that two or more addressing modes can be used. The H8S/2600 CPU supports the eight addressing modes listed next. Effective address calculation is described in section 1.7, Addressing Modes and Effective Address Calculation.

Symbol	Addressing Mode
Rn	Register direct
@ERn	Register indirect
@(d:16, ERn)/@(d:32, ERn)	Register indirect with displacement (16-bit or 32-bit)
@ERn+/@-ERn	Register indirect with post-increment or pre-decrement
@aa:8/@aa:16/@aa:24/@aa:32	Absolute address (8-bit, 16-bit, 24-bit, or 32-bit)
#xx:8/#xx:16/#xx:32	Immediate (8-bit, 16-bit, or 32-bit)
@(d:8, PC)/@(d:16, PC)	Program-counter relative (8-bit or 16-bit)
@@aa:8	Memory indirect

The suffixes :8, :16, :24, and :32 may be omitted. In particular, if the :8, :16, :24, or :32 designation is omitted in an absolute address or displacement, the assembler will optimize the length according to the value range. For details, refer to the H8S, H8/300 Series cross assembler user's manual.

Note: “:2” and “:3” in “#xx (:2)” and “#xx (:3)” indicate the specifiable bit length. Do not include (:2) or (:3) in the assembler notation.

Example: TRAPA #3

2.1.2 Operation

The symbols used in the operation descriptions are defined as follows.

Rd	General register (destination)*
Rs	General register (source)*
Rn	General register*
ERn	General register (32-bit register)
MAC	Multiply-accumulate register (32-bit register)
(EAd)	Destination operand
(EAs)	Source operand
EXR	Extended control register
CCR	Condition-code register
N	N (negative) flag in CCR
Z	Z (zero) flag in CCR
V	V (overflow) flag in CCR
C	C (carry) flag in CCR
PC	Program counter
SP	Stack pointer
#IMM	Immediate data
disp	Displacement
+	Add
−	Subtract
×	Multiply
÷	Divide
^	Logical AND
∨	Logical OR
⊕	Logical exclusive OR
→	Transfer from the operand on the left to the operand on the right, or transition from the state on the left to the state on the right
¬	Logical NOT (logical complement)
() < >	Contents of effective address of the operand
:8/:16/ :24/:32	8-, 16-, 24-, or 32-bit length

Note: *General registers include 8-bit registers (R0H to R7H and R0L to R7L), 16-bit registers (R0 to R7 and E0 to E7), and 32-bit registers (ER0 to ER7).

2.1.3 Condition Code

The symbols used in the condition-code description are defined as follows.

Symbol	Meaning
↕	Changes according to the result of instruction execution
*	Undetermined (no guaranteed value)
0	Always cleared to 0
1	Always set to 1
—	Not affected by execution of the instruction
Δ	Varies depending on conditions; see the notes

For details on changes of the condition code, see section 2.8, Condition Code Modification.

2.1.4 Instruction Format

The symbols used in the instruction format descriptions are listed below.

Symbol	Meaning
IMM	Immediate data (2, 3, 8, 16, or 32 bits)
abs	Absolute address (8, 16, 24, or 32 bits)
disp	Displacement (8, 16, or 32 bits)
rs, rd, rn	Register field (4 bits). The symbols rs, rd, and rn correspond to operand symbols Rs, Rd, and Rn.
ers, erd, ern	Register field (3 bits). The symbols ers, erd, and ern correspond to operand symbols ERs, ERd, and ERn.

2.1.5 Register Specification

Address Register Specification: When a general register is used as an address register [$@ERn$, $@(d:16, ERn)$, $@(d:32, ERn)$, $@ERn+$, or $@-ERn$], the register is specified by a 3-bit register field (ers or erd).

Data Register Specification: A general register can be used as a 32-bit, 16-bit, or 8-bit data register.

When used as a 32-bit register, it is specified by a 3-bit register field (ers, erd, or ern).

When used as a 16-bit register, it is specified by a 4-bit register field (rs, rd, or rn). The lower 3 bits specify the register number. The upper bit is set to 1 to specify an extended register (En) or cleared to 0 to specify a general register (Rn).

When used as an 8-bit register, it is specified by a 4-bit register field (rs, rd, or rn). The lower 3 bits specify the register number. The upper bit is set to 1 to specify a low register (RnL) or cleared to 0 to specify a high register (RnH). This is shown next.

Address Register 32-Bit Register		16-Bit Register		8-Bit Register	
Register Field	General Register	Register Field	General Register	Register Field	General Register
000	ER0	0000	R0	0000	R0H
001	ER1	0001	R1	0001	R1H
.	.	.	.	.	.
.	.	.	.	.	.
111	ER7	0111	R7	0111	R7H
		1000	E0	1000	R0L
		1001	E1	1001	R1L
		.	.	.	.
		.	.	.	.
		1111	E7	1111	R7L

2.1.6 Bit Data Access in Bit Manipulation Instructions

Bit data is accessed as the n-th bit ($n = 0, 1, 2, 3, \dots, 7$) of a byte operand in a general register or memory. The bit number is given by 3-bit immediate data, or by the lower 3 bits of a general register value.

Example 1: To set bit 3 in R2H to 1

BSET R1L, R2H

Example 2: To load bit 5 at address H'FFFF02 into the bit accumulator

BLD #5, @H'FFFF02

The operand size and addressing mode are as indicated for register or memory operand data.

2.2 Instruction Descriptions

The instructions are described starting in section 2.2.1.

2.2.1 (1) ADD (B)

ADD (ADD Binary)

Add Binary

Operation

Rd + (EAs) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

ADD.B <EAs>, Rd

Operand Size

Byte

H: Set to 1 if there is a carry at bit 3; otherwise cleared to 0.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Set to 1 if an overflow occurs; otherwise cleared to 0.

C: Set to 1 if there is a carry at bit 7; otherwise cleared to 0.

Description

This instruction adds the source operand to the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd.

Available Registers

Rd: R0L to R7L, R0H to R7H

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	ADD.B	#xx:8, Rd	8	rd	IMM		1
Register direct	ADD.B	Rs, Rd	0	8	rs	rd	1

Notes

2.2.1 (2) ADD (W)

ADD (ADD Binary)

Add Binary

Operation

Rd + (EAs) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

ADD.W <EAs>, Rd

- H: Set to 1 if there is a carry at bit 11; otherwise cleared to 0.
- N: Set to 1 if the result is negative; otherwise cleared to 0.
- Z: Set to 1 if the result is zero; otherwise cleared to 0.
- V: Set to 1 if an overflow occurs; otherwise cleared to 0.
- C: Set to 1 if there is a carry at bit 15; otherwise cleared to 0.

Operand Size

Word

Description

This instruction adds the source operand to the contents of a 16-bit register Rd (destination operand) and stores the result in the 16-bit register Rd.

Available Registers

Rd: R0 to R7, E0 to E7

Rs: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	ADD.W	#xx:16, Rd	7 9	1 rd	IMM		2
Register direct	ADD.W	Rs, Rd	0 9	rs rd			1

Notes

2.2.1 (3) ADD (L)

ADD (ADD Binary)

Add Binary

Operation

ERd + (EAs) → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

ADD.L <EAs>, ERd

H: Set to 1 if there is a carry at bit 27; otherwise cleared to 0.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Set to 1 if an overflow occurs; otherwise cleared to 0.

C: Set to 1 if there is a carry at bit 31; otherwise cleared to 0.

Operand Size

Longword

Description

This instruction adds the source operand to the contents of a 32-bit register ERd (destination operand) and stores the result in the 32-bit register ERd.

Available Registers

ERd: ER0 to ER7

ERs: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte	4th byte	5th byte	6th byte	
Immediate	ADD.L	#xx:32, ERd	7	A	1	0:erd	IMM				3
Register direct	ADD.L	ERs, ERd	0	A	1:ers	0:erd					1

Notes

2.2.2 ADDS

ADDS (ADD with Sign extension)

Add Binary Address Data

Operation

Rd + 1 → ERd

Rd + 2 → ERd

Rd + 4 → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	—	—	—	—

Assembly-Language Format

ADDS #1, ERd

ADDS #2, ERd

ADDS #4, ERd

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Longword

Description

This instruction adds the immediate value 1, 2, or 4 to the contents of a 32-bit register ERd (destination operand). Unlike the ADD instruction, it does not affect the condition code flags.

Available Registers

ERd: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	ADDS	#1, ERd	0 B	0 0:erd			1
Register direct	ADDS	#2, ERd	0 B	8 0:erd			1
Register direct	ADDS	#4, ERd	0 B	9 0:erd			1

Notes

2.2.3 ADDX

ADDX (ADD with eXtend carry)

Add with Carry

Operation

$Rd + (EAs) + C \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

ADDX <EAs>, Rd

Operand Size

Byte

- H: Set to 1 if there is a carry at bit 3; otherwise cleared to 0.
- N: Set to 1 if the result is negative; otherwise cleared to 0.
- Z: Set to 1 if the result is zero; otherwise cleared to 0.
- V: Set to 1 if an overflow occurs; otherwise cleared to 0.
- C: Set to 1 if there is a carry at bit 7; otherwise cleared to 0.

Description

This instruction adds the source operand and carry flag to the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd.

Available Registers

Rd: R0L to R7L, R0H to R7H

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	ADDX	#xx:8, Rd	9	rd	IMM		1
Register direct	ADDX	Rs, Rd	0	E	rs	rd	1

Notes

2.2.4 (1) AND (B)

AND (AND logical)

Logical AND

Operation

$Rd \wedge (EAs) \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	—

Assembly-Language Format

AND .B <EAs>, Rd

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Previous value remains unchanged.

Operand Size

Byte

Description

This instruction ANDs the source operand with the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd.

Available Registers

Rd: R0L to R7L, R0H to R7H

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	AND.B	#xx:8, Rd	E rd	IMM			1
Register direct	AND.B	Rs, Rd	1 6	rs rd			1

Notes

2.2.4 (2) AND (W)

AND (AND logical)

Logical AND

Operation

$Rd \wedge (EAs) \rightarrow Rd$

Condition Code

Assembly-Language Format

AND.W <EAs>, Rd

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Previous value remains unchanged.

Operand Size

Word

Description

This instruction ANDs the source operand with the contents of a 16-bit register Rd (destination operand) and stores the result in the 16-bit register Rd.

Available Registers

Rd: R0 to R7, E0 to E7

Rs: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States	
			1st byte	2nd byte	3rd byte	4th byte		
Immediate	AND.W	#xx:16, Rd	7	9	6	rd	IMM	2
Register direct	AND.W	Rs, Rd	6	6	rs	rd		1

Notes

2.2.4 (3) AND (L)

AND (AND logical)

Logical AND

Operation

$ERd \wedge (EAs) \rightarrow ERd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	—

Assembly-Language Format

AND . L <EAs>, ERd

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Previous value remains unchanged.

Operand Size

Longword

Description

This instruction ANDs the source operand with the contents of a 32-bit register ERd (destination operand) and stores the result in the 32-bit register ERd.

Available Registers

ERd: ER0 to ER7

ERs: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States				
			1st byte		2nd byte		3rd byte		4th byte			5th byte		6th byte

Assembly-Language Format

BCC disp

└──────────► Condition field

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

—

Description

If the condition specified in the condition field (cc) is true, a displacement is added to the program counter (PC) and execution branches to the resulting address. If the condition is false, the next instruction is executed. The PC value used in the address calculation is the starting address of the instruction immediately following the Bcc instruction. The displacement is a signed 8-bit or 16-bit value. The branch destination address can be located in the range from -126 to +128 bytes or -32766 to +32768 bytes from the Bcc instruction.

Mnemonic	Meaning	cc	Condition	Signed/Unsigned*
BRA (BT)	Always (true)	0000	True	
BRN (BF)	Never (false)	0001	False	
BHI	High	0010	$C \vee Z = 0$	$X > Y$ (unsigned)
BLS	Low or Same	0011	$C \vee Z = 1$	$X \leq Y$ (unsigned)
BCC (BHS)	Carry Clear (High or Same)	0100	$C = 0$	$X \geq Y$ (unsigned)
BCS (BLO)	Carry Set (LOW)	0101	$C = 1$	$X < Y$ (unsigned)
BNE	Not Equal	0110	$Z = 0$	$X \neq Y$ (unsigned or signed)
BEQ	Equal	0111	$Z = 1$	$X = Y$ (unsigned or signed)
BVC	oVerflow Clear	1000	$V = 0$	
BVS	oVerflow Set	1001	$V = 1$	
BPL	PLus	1010	$N = 0$	
BMI	MInus	1011	$N = 1$	
BGE	Greater or Equal	1100	$N \oplus V = 0$	$X \geq Y$ (signed)
BLT	Less Than	1101	$N \oplus V = 1$	$X < Y$ (signed)
BGT	Greater Than	1110	$Z \vee (N \oplus V) = 0$	$X > Y$ (signed)
BLE	Less or Equal	1111	$Z \vee (N \oplus V) = 1$	$X \leq Y$ (signed)

Note: * If the immediately preceding instruction is a CMP instruction, X is the general register contents (destination operand) and Y is the source operand.

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Program-counter relative	BRA (BT)	d:8	4	0	disp		2

BSR (Branch to SubRoutine)

Branch to Subroutine

Operation

PC → @-SP
PC + disp → PC

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	—	—	—	—

Assembly-Language Format

BSR disp

- H: Previous value remains unchanged.
- N: Previous value remains unchanged.
- Z: Previous value remains unchanged.
- V: Previous value remains unchanged.
- C: Previous value remains unchanged.

Operand Size

—

Description

This instruction branches to a subroutine at a specified address. It pushes the program counter (PC) value onto the stack as a restart address, then adds a specified displacement to the PC value and branches to the resulting address. The PC value pushed onto the stack is the address of the instruction following the BSR instruction. The displacement is a signed 8-bit or 16-bit value, so the possible branching range is -126 to +128 bytes or -32766 to +32768 bytes from the address of the BSR instruction.

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States	
			1st byte	2nd byte	3rd byte	4th byte	Normal	Advanced
Program-counter relative	BSR	d:8	5	5	disp		3	4
		d:16	5	C	0	0	disp	5

Notes

The stack structure differs between normal mode and advanced mode. In normal mode only the lower 16 bits of the program counter are pushed onto the stack.

Ensure that the branch destination address is even.

2.2.19 **BST**

BST (Bit STore)

Bit Store

Operation	Condition Code																
C → (<bit No.> of <EAd>)	<table><tr><td>I</td><td>UI</td><td>H</td><td>U</td><td>N</td><td>Z</td><td>V</td><td>C</td></tr><tr><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td></tr></table>	I	UI	H	U	N	Z	V	C	—	—	—	—	—	—	—	—

Assembly-Language Format	H: Previous value remains unchanged. N: Previous value remains unchanged. Z: Previous value remains unchanged. V: Previous value remains unchanged. C: Previous value remains unchanged.																
CLRMAC																	
Operand Size																	
—																	

Description

This instruction simultaneously clears registers MACH and MACL.
It is supported only by the H8S/2600 CPU.

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format						No. of States
			1st byte		2nd byte		3rd byte	4th byte	
—	CLRMAC	—	0	1	A	0			2*

Note: * A maximum of three additional states are required for execution of this instruction within three states after execution of a MAC instruction. For example, if there is a one-state instruction (such as NOP) between the MAC instruction and this instruction, this instruction will be two states longer.

Notes

Execution of this instruction also clears the overflow flag in the multiplier to 0.

CMP (CoMPare)**Compare****Operation**

Rd – (EAs), set/clear CCR

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

CMP.B <EAs>, Rd

Operand Size

Byte

H: Set to 1 if there is a borrow at bit 3; otherwise cleared to 0.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Set to 1 if an overflow occurs; otherwise cleared to 0.

C: Set to 1 if there is a borrow at bit 7; otherwise cleared to 0.

Description

This instruction subtracts the source operand from the contents of an 8-bit register Rd (destination operand) and sets or clears the condition code bits according to the result. The contents of the 8-bit register Rd remain unchanged.

Available Registers

DAA (Decimal Adjust Add)**Decimal Adjust****Operation**

Rd (decimal adjust) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	*	—	↕	↕	*	↕

Assembly-Language Format

DAA Rd

Operand Size

Byte

- H: Undetermined (no guaranteed value).
 N: Set to 1 if the adjusted result is negative; otherwise cleared to 0.
 Z: Set to 1 if the adjusted result is zero; otherwise cleared to 0.
 V: Undetermined (no guaranteed value).
 C: Set to 1 if there is a carry at bit 7; otherwise left unchanged.

Description

Given that the result of an addition operation performed by an ADD.B or ADDX instruction on 4-bit BCD data is contained in an 8-bit register Rd and the carry and half-carry flags, the DAA instruction adjusts the contents of the 8-bit register Rd (destination operand) by adding H'00, H'06, H'60, or H'66 according to the table below.

C Flag before Adjustment	Upper 4 Bits before Adjustment	H Flag before Adjustment	Lower 4 Bits before Adjustment	Value Added (Hexadecimal)	C Flag after Adjustment
0	0 to 9	0	0 to 9	00	0
0	0 to 8	0	A to F	06	0
0	0 to 9	1	0 to 3	06	0
0	A to F	0	0 to 9	60	1
0	9 to F	0	A to F	66	1
0	A to F	1	0 to 3	66	1
1	1 to 2	0	0 to 9	60	1
1	1 to 2	0	A to F	66	1
1	1 to 3	1	0 to 3	66	1

Available Registers

Rd: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	DAA	Rd	0 F	0 rd			1

Notes

Valid results (8-bit register Rd contents and C, V, Z, N, and H flags) are not assured if this instruction is executed under conditions other than those described above.

DAS (Decimal Adjust Subtract)**Decimal Adjust****Operation**

Rd (decimal adjust) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	*	—	↕	↕	*	0

Assembly-Language Format

DAS Rd

Operand Size

Byte

H: Undetermined (no guaranteed value).

N: Set to 1 if the adjusted result is negative; otherwise cleared to 0.

Z: Set to 1 if the adjusted result is zero; otherwise cleared to 0.

V: Undetermined (no guaranteed value).

C: Previous value remains unchanged.

Description

Given that the result of a subtraction operation performed by a SUB.B, SUBX.B, or NEG.B instruction on 4-bit BCD data is contained in an 8-bit register Rd and the carry and half-carry flags, the DAS instruction adjusts the contents of the 8-bit register Rd (destination operand) by adding H'00, H'FA, H'A0, or H'9A according to the table below.

C Flag before Adjustment	Upper 4 Bits before Adjustment	H Flag before Adjustment	Lower 4 Bits before Adjustment	Value Added (Hexadecimal)	C Flag after Adjustment
0	0 to 9	0	0 to 9	00	0
0	0 to 8	1	6 to F	FA	0
1	7 to F	0	0 to 9	A0	1
1	6 to F	1	6 to F	9A	1

—	—	—	—	↕	↕	—	—

Assembly-Language Format

DIVXS.B Rs, Rd

H: Previous value remains unchanged.

N: Set to 1 if the quotient is negative; otherwise cleared to 0.

Z: Set to 1 if the divisor is zero; otherwise cleared to 0.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Byte

Description

This instruction divides the contents of a 16-bit register Rd (destination operand) by the contents of an 8-bit register Rs (source operand) and stores the result in the 16-bit register Rd. The division is signed. The operation performed is 16 bits $\div$ 8 bits $\rightarrow$ 8-bit quotient and 8-bit remainder. The quotient is placed in the lower 8 bits of Rd. The remainder is placed in the upper 8 bits of Rd. The sign of the remainder matches the sign of the dividend.

Valid results are not assured if division by zero is attempted or an overflow occurs.

Available Registers

Rd: R0 to R7, E0 to E7

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
Register direct	DIVXS.B	Rs, Rd	0	1	D	0	5	1	rs	rd	13

Notes

The N flag is set to 1 if the dividend and divisor have different signs, and cleared to 0 if they have the same sign. The N flag may therefore be set to 1 when the quotient is zero.

DIVXS (DIVide eXtend as Signed)

Divide Signed

Operation

$ERd \div Rs \rightarrow ERd$

Condition Code

—	—	—	—	↕	↕	—	—

Assembly-Language Format

`DIVXS.W Rs, ERd`

H: Previous value remains unchanged.

N: Set to 1 if the quotient is negative; otherwise cleared to 0.

Z: Set to 1 if the divisor is zero; otherwise cleared to 0.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Word

Description

This instruction divides the contents of a 32-bit register ERd (destination operand) by the contents of a 16-bit register Rs (source operand) and stores the result in the 32-bit register ERd. The division is signed. The operation performed is 32 bits $\div$ 16 bits $\rightarrow$ 16-bit quotient and 16-bit remainder. The quotient is placed in the lower 16 bits (Rd) of the 32-bit register ERd. The remainder is placed in the upper 16 bits (Ed). The sign of the remainder matches the sign of the dividend.

Valid results are not assured if division by zero is attempted or an overflow occurs.

Available Registers

ERd: ER0 to ER7

Rs: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
Register direct	DIVXS.W	Rs, ERd	0	1	D	0	5	3	rs	0:erd	21

Notes

The N flag is set to 1 if the dividend and divisor have different signs, and cleared to 0 if they have the same sign. The N flag may therefore be set to 1 when the quotient is zero.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

—

Description

This instruction performs a block data transfer. It moves data from the memory location specified in ER5 to the memory location specified in ER6, increments ER5 and ER6, decrements R4L, and repeats these operations until R4L reaches zero. Execution then proceeds to the next instruction. The data transfer is performed a byte at a time, with R4L indicating the number of bytes to be transferred. The byte symbol in the assembly-language format designates the size of R4L (and limits the maximum number of bytes that can be transferred to 255). No interrupts are detected while the block transfer is in progress.

When the EEPMOV.B instruction ends, R4L contains 0 (zero), and ER5 and ER6 contain the last transfer address + 1.

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
—	EEPMOV.B		7 B	5 C	5 9	8 F	4 + 2n*

Note: * n is the initial value of R4L. Although n bytes of data are transferred, 2(n + 1) data accesses are performed, requiring 2(n + 1) states. (n = 0, 1, 2, ..., 255).

Notes

This instruction first reads the memory locations indicated by ER5 and ER6, then carries out the block data transfer.

EEPMOV (MOVE data to EEPROM)

Block Data Transfer

Operation	Condition Code																
if R4 ≠ 0 then repeat @ER5+ → @ER6+ R4 – 1 → R4 until R4 = 0 else next;	<table><tr><td>I</td><td>UI</td><td>H</td><td>U</td><td>N</td><td>Z</td><td>V</td><td>C</td></tr><tr><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td></tr></table> H: Previous value remains unchanged. I	UI	H	U	N	Z	V	C										
—	—	—	—	—	—	—	—										

Assembly-Language Format

EEPMOV.W

Operand Size

—

Description

This instruction performs a block data transfer. It moves data from the memory location specified in ER5 to the memory location specified in ER6, increments ER5 and ER6, decrements R4, and repeats these operations until R4 reaches zero. Execution then proceeds to the next instruction. The data transfer is performed a byte at a time, with R4 indicating the number of bytes to be transferred. The word symbol in the assembly-language format designates the size of R4 (allowing a maximum 65535 bytes to be transferred). All interrupts are detected while the block transfer is in progress.

If no interrupt occurs while the EEPMOV.W instruction is executing, when the EEPMOV.W instruction ends, R4 contains 0 (zero), and ER5 and ER6 contain the last transfer address + 1.

If an interrupt occurs, interrupt exception handling begins after the current byte has been transferred. R4 indicates the number of bytes remaining to be transferred. ER5 and ER6 indicate the next transfer addresses. The program counter value pushed onto the stack in interrupt exception handling is the address of the next instruction after the EEPMOV.W instruction.

See the note on EEPMOV.W instruction and interrupt.

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
—	EEPMOV.W		7	B	D	4	5	9	8	F	$4 + 2n^*$

Note: * n is the initial value of R4. Although n bytes of data are transferred, $2(n + 1)$ data accesses are performed, requiring $2(n + 1)$ states. (n = 0, 1, 2, ..., 65535).

Notes

This instruction first reads memory at the addresses indicated by ER5 and ER6, then carries out the block data transfer.

EEPMOV.W Instruction and Interrupt

If an interrupt request occurs while the EEPMOV.W instruction is being executed, interrupt exception handling is carried out after the current byte has been transferred. Register contents are then as follows:

ER5: address of the next byte to be transferred

ER6: destination address of the next byte

R4: number of bytes remaining to be transferred

The program counter value pushed on the stack in interrupt exception handling is the address of the next instruction after the EEPMOV.W instruction. Programs should be coded as follows to allow for interrupts during execution of the EEPMOV.W instruction.

Example:

L1: EEPMOV.W

MOV.W R4, R4

BNE L1

Interrupt requests other than NMI are not accepted if they are masked in the CPU.

During execution of the EEPMOV.B instruction no interrupts are accepted, including NMI.

Operand Size																	
Longword																	

Description
This instruction restores data saved on the stack to a specified list of registers. Registers are restored in descending order of register number.
Two, three, or four registers can be restored by one LDM instruction. The following ranges can be specified in the register list.
Two registers: ER0-ER1, ER2-ER3, ER4-ER5, or ER6-ER7
Three registers: ER0-ER2 or ER4-ER6
Four registers: ER0-ER3 or ER4-ER7

Available Registers
ERn: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
—	LDM.L	@SP+, (ERn-ERn+1)	0	1	1	0	6	D	7	0:ern+1	7

—	—	—	—	—	—	—	—

Assembly-Language Format

LDMAC ERs, MAC register

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Longword

Description

This instruction moves the contents of a general register to a multiply-accumulate register (MACH or MACL). If the transfer is to MACH, only the lowest 10 bits of the general register are transferred.

Supported only by the H8S/2600 CPU.

Available Registers

ERs: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format						No. of States
			1st byte		2nd byte		3rd byte	4th byte	
Register direct	LDMAC	ERs, MACH	0	3	2	0	ers		2*
Register direct	LDMAC	ERs, MACL	0	3	3	0	ers		2*

Note: * A maximum of three additional states are required for execution of this instruction within three states after execution of a MAC instruction. For example, if there is a one-state instruction (such as NOP) between the MAC instruction and this instruction, this instruction will be two states longer.

Notes

Execution of this instruction clears the overflow flag in the multiplier to 0.

MAC (Multiply and ACcumulate)**Multiply and Accumulate****Operation**

$(EAn) \times (EAm) + \text{MAC register} \rightarrow$
MAC register

$ERn + 2 \rightarrow ERn$

$ERm + 2 \rightarrow ERm$

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

—

Description

This instruction performs signed multiplication on two 16-bit operands at addresses given by the contents of general registers ERn and ERm, adds the 32-bit product to the contents of the MAC register, and stores the sum in the MAC register. After this operation, ERn and ERm are both incremented by 2.

The operation can be carried out in saturating or non-saturating mode, depending on the MACS bit in a system control register. (SYSCR)

See the relevant hardware manual for further information.

In non-saturating mode, MACH and MACL are concatenated to store a 42-bit result. The value of bit 41 is copied into the upper 22 bits of MACH as a sign extension.

In saturating mode, only MACL is valid, and the result is limited to the range from H'80000000 (minimum value) to H'7FFFFFFF (maximum value). If the result overflows in the negative direction, H'80000000 (the minimum value) is stored in MACL. If the result overflows in the positive direction, H'7FFFFFFF (the maximum value) is stored in MACL. The LSB of the MACH register indicates the status of the overflow flag (V-MULT) in the multiplier. Other bits retain their previous contents.

This instruction is supported only by the H8S/2600 CPU.

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States		
			1st byte		2nd byte		3rd byte		4th byte				
Register indirect with post-increment	MAC	@ERn+, @ERm+	0	1	6	0	6	D	0	ern	0	erm	4

Notes

1. Flags (N, Z, V) indicating the result of the MAC instruction can be set in the condition-code register (CCR) by the STMAC instruction.
2. If ERn and ERm are the same register, the execution addresses are ERn and ERn + 2. After execution, the value of ERn is ERn + 4.
3. If MACS is modified during execution of a MAC instruction, the result cannot be guaranteed. It is essential to wait for at least three states after a MAC instruction before modifying MACS.

Further Explanation of Instructions Using Multiplier

1. Modification of flags

The multiplier has N-MULT, Z-MULT, and V-MULT flags that indicate the results of MAC instructions. These flags are separated from the condition-code register (CCR). The values of these flags can be set in the N, Z, and V flags of the CCR only by the STMAC instruction.

N-MULT and Z-MULT are modified only by MAC instructions. V-MULT retains a value indicating whether an overflow has occurred in the past, until it is cleared by execution of the CLRMAC or LDMAC instruction.

The setting and clearing conditions for these flags are given below.

- N-MULT (negative flag)

Saturating mode	Set when bit 31 of register MACL is set to 1 by execution of a MAC instruction
	Cleared when bit 31 of register MACL is cleared to 0 by execution of a MAC instruction
Non-saturating mode	Set when bit 41 of register MACH is set to 1 by execution of a MAC instruction
	Cleared when bit 41 of register MACH is cleared to 0 by execution of a MAC instruction

- Z-MULT (zero flag)

Saturating mode	Set when register MACL is cleared to 0 by execution of a MAC instruction
	Cleared when register MACL is not cleared to 0 by execution of a MAC instruction
Non-saturating mode	Set when registers MACH and MACL are both cleared to 0 by execution of a MAC instruction
	Cleared when register MACH or MACL is not cleared to 0 by execution of a MAC instruction

- V-MULT (overflow flag)

Saturating mode	Set when the result of the MAC instruction overflows the range from H'80000000 (minimum) to H'7FFFFFFF (maximum)
	Cleared when a CLRMAC or LDMAC instruction is executed Note: Not cleared when the result of the MAC instruction is within the above range
Non-saturating mode	Set when the result of the MAC instruction overflows the range from H'2000000000 (minimum) to H'1FFFFFFFFF (maximum)
	Cleared when a CLRMAC or LDMAC instruction is executed Note: Not cleared when the result of the MAC instruction is within the above range

The N-MULT, Z-MULT, and V-MULT flags are not modified by switching between saturating and non-saturating modes, or by execution of a multiply instruction (MULXU or MULXS).

2. Example

CLRMAC

MAC @ER1+, @ER2+

MAC @ER1+, @ER2+ ←—— Overflow occurs

:

MAC @ER1+, @ER2+ ←—— Result = 0

NOP

STMACH MACH, ER3 ←—— CCR (N = 0, Z = 1, V = 1)

CLRMAC

STMACH MACH, ER3 ←—— CCR (N = 0, Z = 1, V = 0)

$Rd \times Rs \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	—	—

Assembly-Language Format

MULXS.B Rs, Rd

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Byte

Description

This instruction multiplies the lower 8 bits of a 16-bit register Rd (destination operand) by the contents of an 8-bit register Rs (source operand) as signed data and stores the result in the 16-bit register Rd. If Rd is one of general registers R0 to R7, Rs can be the upper part (RdH) or lower part (RdL) of Rd. The operation performed is 8 bits $\times$ 8 bits $\rightarrow$ 16 bits signed multiplication.

Available Registers

Rd: R0 to R7, E0 to E7

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
Register direct	MULXS.B	Rs, Rd	0	1	C	0	5	0	rs	rd	4*

Note: * The number of states in the H8S/2000 CPU is 13.

A maximum of three additional states are required for execution of this instruction within three states after execution of a MAC instruction. For example, if there is a one-state instruction (such as NOP) between the MAC instruction and this instruction, this instruction will be two states longer.

Notes

2.2.42 (2) MULXS (W)

MULXS (MULTiply eXtend as Signed)

Multiply Signed

Operation

$ERd \times Rs \rightarrow ERd$

Condition Code

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Word

Description

This instruction multiplies the lower 16 bits of a 32-bit register ERd (destination operand) by the contents of a 16-bit register Rs (source operand) as unsigned data and stores the result in the 32-bit register ERd. Rs can be the upper part (Ed) or lower part (Rd) of ERd. The operation performed is 16 bits $\times$ 16 bits $\rightarrow$ 32 bits unsigned multiplication.

Available Registers

ERd: ER0 to ER7

Rs: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	MULXU.W	Rs, ERd	5	2	rs	0:erd	4*

Note: * The number of states in the H8S/2000 CPU is 20.

A maximum of three additional states are required for execution of this instruction within three states after execution of a MAC instruction. For example, if there is a one-state instruction (such as NOP) between the MAC instruction and this instruction, this instruction will be two states longer.

Notes

2.2.44 (1) NEG (B)

NEG (NEGate)

Negate Binary Signed

Operation

0 – Rd → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

NEG.B Rd

H: Set to 1 if there is a borrow at bit 3; otherwise cleared to 0.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Set to 1 if an overflow occurs; otherwise cleared to 0.

C: Set to 1 if there is a borrow at bit 7; otherwise cleared to 0.

Operand Size

Byte

Description

This instruction takes the two's complement of the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd (subtracting the register contents from H'00). If the original contents of Rd were H'80, however, the result remains H'80.

Available Registers

Rd: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	NEG.B	Rd	1 7	8 rd			1

Notes

An overflow occurs if the original contents of Rd were H'80.

	C: Previous value remains unchanged.																
Operand Size																	
Longword																	

Description

This instruction restores data from the stack to a 32-bit general register ERn, tests the restored data, and sets condition-code flags according to the result.

Available Registers

ERn: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
—	POP.L	ERn	0	1	0	0	6	D	7	0:ern	5

Notes

POP.L ERn is identical to MOV.L @SP+, ERn.

2.2.50 (1) PUSH (W)

PUSH (PUSH data)

Push Data on Stack

Operation

Rn → @-SP

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	—

Assembly-Language Format

PUSH.W Rn

H: Previous value remains unchanged.

N: Set to 1 if the transferred data is negative; otherwise cleared to 0.

Z: Set to 1 if the transferred data is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Previous value remains unchanged.

Operand Size

Word

Description

This instruction saves data from a 16-bit register Rn onto the stack, tests the saved data, and sets condition-code flags according to the result.

Available Registers

Rn: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
—	PUSH.W	Rn	6 D	F rn			3

Notes

1. PUSH.W Rn is identical to MOV.W Rn, @-SP.
2. When PUSH.W R7 or PUSH.W E7 is executed, the value saved on the stack is the R7 or E7 value after effective address calculation (after ER7 is decremented by 2).

2.2.50 (2) PUSH (L)

PUSH (PUSH data)

Push Data on Stack

Operation

ERn → @-SP

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↑	↑	0	—

Assembly-Language Format

PUSH.L ERn

H: Previous value remains unchanged.

N: Set to 1 if the transferred data is negative; otherwise cleared to 0.

Z: Set to 1 if the transferred data is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Previous value remains unchanged.

Operand Size

Longword

Description

This instruction pushes data from a 32-bit register ERn onto the stack, tests the saved data, and sets condition-code flags according to the result.

Available Registers

ERn: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
—	PUSH.L	ERn	0	1	0	0	6	D	F	0:ern	5

Notes

1. PUSH.L ERn is identical to MOV.L ERn, @-SP.
2. When PUSH.L ER7 is executed, the value saved on the stack is the ER7 value after effective address calculation (after ER7 is decremented by 4).

2.2.51 (1) ROTL (B)

ROTL (ROTate Left)

Rotate

Operation

Rd (left rotation) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	↕

Assembly-Language Format

ROTL.B Rd

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Receives the previous value in bit 7.

Operand Size

Byte

Description

This instruction rotates the bits in an 8-bit register Rd (destination operand) one bit to the left. The most significant bit (bit 7) is rotated to the least significant bit (bit 0), and also copied to the carry flag.

Available Registers

Rd: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte

- I: Restored from the corresponding bit on the stack.
- UI: Restored from the corresponding bit on the stack.
- H: Restored from the corresponding bit on the stack.
- U: Restored from the corresponding bit on the stack.
- N: Restored from the corresponding bit on the stack.
- Z: Restored from the corresponding bit on the stack.
- V: Restored from the corresponding bit on the stack.
- C: Restored from the corresponding bit on the stack.

Description

This instruction returns from an exception-handling routine by restoring the EXR, condition-code register (CCR) and program counter (PC) from the stack. Program execution continues from the address restored to the program counter. The CCR and PC contents at the time of execution of this instruction are lost. If the extended control register (EXR) is valid, it is also restored (and the existing EXR contents are lost).

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
—	RTE		5	6	7	0	5*

Note: * Six states when EXR is valid.

Notes

The stack structure differs between normal mode and advanced mode.

N: Set to 1 if the result is negative; otherwise cleared to 0.
Z: Set to 1 if the result is zero; otherwise cleared to 0.
V: Set to 1 if an overflow occurs; otherwise cleared to 0.
C: Receives the previous value in bit 7.

Operand Size

Byte

Description

This instruction shifts the bits in an 8-bit register Rd (destination operand) one bit to the left. The most significant bit (bit 7) shifts into the carry flag. The least significant bit (bit 0) is cleared to 0.

Available Registers

Rd: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	SHAL.B	Rd	1 0	8 rd			1

Notes

The SHAL instruction differs from the SHLL instruction in its effect on the overflow flag.

2.2.57 (3) SHAL (W)

SHAL (SHift Arithmetic Left)

Shift Arithmetic

Operation

Rd (left arithmetic shift) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	↕	↕

Assembly-Language Format

SHAL.W Rd

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Set to 1 if an overflow occurs; otherwise cleared to 0.

C: Receives the previous value in bit 15.

Operand Size

Word

Description

This instruction shifts the bits in a 16-bit register Rd (destination operand) one bit to the left. The most significant bit (bit 15) shifts into the carry flag. The least significant bit (bit 0) is cleared to 0.

Available Registers

Rd: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	SHAL.W	Rd	1 0	9 rd			1

Notes

The SHAL instruction differs from the SHLL instruction in its effect on the overflow flag.

SHAL (SHift Arithmetic Left)

Shift Arithmetic

Operation

Rd (left arithmetic shift) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	↕	↕

Assembly-Language Format

SHAL .W #2, Rd

- H: Previous value remains unchanged.
N: Set to 1 if the result is negative; otherwise cleared to 0.
Z: Set to 1 if the result is zero; otherwise cleared to 0.
V: Set to 1 if an overflow occurs; otherwise cleared to 0.
C: Receives the previous value in bit 14.

Operand Size

Word

Description

This instruction shifts the bits in a 16-bit register Rd (destination operand) two bits to the left. Bit 14 shifts into the carry flag. Bits 0 and 1 are cleared to 0.

Available Registers

Rd: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format						No. of States
			1st byte		2nd byte		3rd byte	4th byte	
Register direct	SHAL.W	#2, Rd	1	0	D	rd			1

Notes

The SHAL instruction differs from the SHLL instruction in its effect on the overflow flag.

2.2.57 (5) SHAL (L)

SHAL (SHift Arithmetic Left)

Shift Arithmetic

Operation

ERd (left arithmetic shift) → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	↕	↕

Assembly-Language Format

SHAL.L ERd

- H: Previous value remains unchanged.
N: Set to 1 if the result is negative; otherwise cleared to 0.
Z: Set to 1 if the result is zero; otherwise cleared to 0.
V: Set to 1 if an overflow occurs; otherwise cleared to 0.
C: Receives the previous value in bit 31.

Operand Size

Longword

Description

This instruction shifts the bits in a 32-bit register ERd (destination operand) one bit to the left. The most significant bit (bit 31) shifts into the carry flag. The least significant bit (bit 0) is cleared to 0.

Available Registers

ERd: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	SHAL.L	ERd	1 0	B 0	erd		1

Notes

The SHAL instruction differs from the SHLL instruction in its effect on the overflow flag.

SHAL (SHift Arithmetic Left)

Shift Arithmetic

Operation

ERd (left arithmetic shift) → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	↕	↕

Assembly-Language Format

SHAL . L #2, ERd

- H: Previous value remains unchanged.
- N: Set to 1 if the result is negative; otherwise cleared to 0.
- Z: Set to 1 if the result is zero; otherwise cleared to 0.
- V: Set to 1 if an overflow occurs; otherwise cleared to 0.
- C: Receives the previous value in bit 30.

Operand Size

Longword

Description

This instruction shifts the bits in a 32-bit register ERd (destination operand) two bits to the left. Bit 30 shifts into the carry flag. Bits 0 and 1 are cleared to 0.

Available Registers

ERd: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	SHAL.L	#2, ERd	1 0	F 0:erd			1

Notes

The SHAL instruction differs from the SHLL instruction in its effect on the overflow flag.

2.2.58 (1) SHAR (B)

SHAR (SHift Arithmetic Right)

Shift Arithmetic

Operation

Rd (right arithmetic shift) → Rd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	↕

Assembly-Language Format

SHAR.B Rd

- H: Previous value remains unchanged.
N: Set to 1 if the result is negative; otherwise cleared to 0.
Z: Set to 1 if the result is zero; otherwise cleared to 0.
V: Always cleared to 0.
C: Receives the previous value in bit 0.

Operand Size

Byte

Description

This instruction shifts the bits in an 8-bit register Rd (destination operand) one bit to the right. Bit 0 shifts into the carry flag. Bit 7 shifts into itself. Since bit 7 remains unaltered, the sign does not change.

Available Registers

Rd: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte

Assembly-Language Format																	
SLEEP	H: Previous value remains unchanged. N: Previous value remains unchanged. Z: Previous value remains unchanged. V: Previous value remains unchanged. C: Previous value remains unchanged.																
Operand Size																	
—																	

Description

When the SLEEP instruction is executed, the CPU enters a power-down mode. Its internal state remains unchanged, but the CPU stops executing instructions and waits for an exception-handling request. When it receives an exception-handling request, the CPU exits the power-down mode and begins the exception-handling sequence. Interrupt requests other than NMI cannot end the power-down mode if they are masked in the CPU.

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	—	—	—	—

Assembly-Language Format

STC.W CCR, <EAd>

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Word

Description

This instruction copies the CCR contents to a destination location. Although CCR is a byte register, the destination operand is a word operand. The CCR contents are stored at the even address. Undetermined data is stored at the odd address.

Available Registers

ERd: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format										No. of States
			1st byte	2nd byte	3rd byte	4th byte	5th byte	6th byte	7th byte	8th byte	9th byte	10th byte	
Register indirect	STC.W	CCR, @ERd	0 1	4 0	6 9	1-erd 0							3

	STC.W	EXR, @aa:32	0 1	4 1	6 B	A 0	abs						5

Notes

STM (STore from Multiple registers)

Store Data on Stack

Operation

ERn (register list) → @-SP

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	—	—	—	—

Assembly-Language Format

STM . L <register list>, @-SP

- H: Previous value remains unchanged.
N: Previous value remains unchanged.
Z: Previous value remains unchanged.
V: Previous value remains unchanged.
C: Previous value remains unchanged.

Operand Size

Longword

Description

This instruction saves a group of registers specified by a register list onto the stack. The registers are saved in ascending order of register number.

Two, three, or four registers can be saved by one STM instruction. The following ranges can be specified in the register list.

Two registers: ER0-ER1, ER2-ER3, ER4-ER5, or ER6-ER7

Three registers: ER0-ER2 or ER4-ER6

Four registers: ER0-ER3 or ER4-ER7

Available Registers

ERn: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte		4th byte		
—	STM.L	(ERn-ERn+1), @-SP	0	1	1	0	6	D	F	0: ern	7
—	STM.L	(ERn-ERn+2), @-SP	0	1	2	0	6	D	F	0: ern	9
—	STM.L	(ERn-ERn+3), @-SP	0	1	3	0	6	D	F	0: ern	11

Notes

When ER7 is saved, the value after effective address calculation (after ER7 is decremented by 4) is saved on the stack.

STMAC (STore from MAC register)

Store Data from MAC Register

Operation

MACH → ERd

or

MACL → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕*	↕*	↕*	—

Assembly-Language Format

STMAC MAC register, ERd

Operand Size

Longword

H: Previous value remains unchanged.

N: Set to 1 if a MAC instruction resulted in a negative MAC register value; otherwise cleared to 0.

Z: Set to 1 if a MAC instruction resulted in a zero MAC register value; otherwise cleared to 0.

V: Set to 1 if a MAC instruction resulted in an overflow; otherwise cleared to 0.

C: Previous value remains unchanged.

Note: * Execution of this instruction copies the N, Z, and V flag values from the multiplier to the condition-code register (CCR). If the STMAC instruction is executed after a CLRMAC or LDMAC instruction with no intervening MAC instruction, the V flag will be 0 and the N and Z flags will have undetermined values.

Description

This instruction moves the contents of a multiply-accumulate register (MACH or MACL) to a general register. If the transfer is from MACH, the upper 22 bits transferred to the general register are a sign extension.

This instruction is supported by the H8S/2600 CPU only.

Available Registers

ERd: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format						No. of States
			1st byte		2nd byte		3rd byte	4th byte	
Register direct	STMAC	MACH, ERd	0	2	2	0	ers		1*
Register direct	STMAC	MACL, ERd	0	2	3	0	ers		1*

Note: * A maximum of three additional states are required for execution of this instruction within three states after execution of a MAC instruction. For example, if there is a one-state instruction (such as NOP) between the MAC instruction and this instruction, this instruction will be two states longer.

Notes

2.2.65 (1) SUB (B)

SUB (SUBtract binary)

Subtract Binary

Operation

$Rd - Rs \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

SUB.B Rs, Rd

- H: Set to 1 if there is a borrow at bit 3; otherwise cleared to 0.
- N: Set to 1 if the result is negative; otherwise cleared to 0.
- Z: Set to 1 if the result is zero; otherwise cleared to 0.
- V: Set to 1 if an overflow occurs; otherwise cleared to 0.
- C: Set to 1 if there is a borrow at bit 7; otherwise cleared to 0.

Operand Size

Byte

Description

This instruction subtracts the contents of an 8-bit register Rs (source operand) from the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd.

Available Registers

Rd: R0L to R7L, R0H to R7H

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	SUB.B	Rs, Rd	1 8	rs rd			1

Notes

The SUB.B instruction can operate only on general registers. Immediate data can be subtracted from general register contents by using the SUBX instruction. Before executing SUBX #xx:8, Rd, first set the Z flag to 1 and clear the C flag to 0. The following coding examples can also be used to subtract nonzero immediate data #IMM.

- (1) ORC #H'05,CCR
 SUBX #(IMM-1),Rd
- (2) ADD #(0-IMM),Rd
 XORC #H'01,CCR

SUB (SUBtract binary)

Subtract Binary

Operation

$Rd - (EAs) \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

SUB.W <EAs>, Rd

- H: Set to 1 if there is a borrow at bit 11; otherwise cleared to 0.
- N: Set to 1 if the result is negative; otherwise cleared to 0.
- Z: Set to 1 if the result is zero; otherwise cleared to 0.
- V: Set to 1 if an overflow occurs; otherwise cleared to 0.
- C: Set to 1 if there is a borrow at bit 15; otherwise cleared to 0.

Operand Size

Word

Description

This instruction subtracts a source operand from the contents of a 16-bit register Rd (destination operand) and stores the result in the 16-bit register Rd.

Available Registers

Rd: R0 to R7, E0 to E7

Rs: R0 to R7, E0 to E7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	SUB.W	#xx:16, Rd	7 9	3 rd	IMM		2
Register direct	SUB.W	Rs, Rd	1 9	rs rd			1

Notes

2.2.65 (3) SUB (L)

SUB (SUBtract binary)

Subtract Binary

Operation

ERd – (EAs) → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

SUB.L <EAs>, ERd

Operand Size

Longword

H: Set to 1 if there is a borrow at bit 27; otherwise cleared to 0.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Set to 1 if an overflow occurs; otherwise cleared to 0.

C: Set to 1 if there is a borrow at bit 31; otherwise cleared to 0.

Description

This instruction subtracts a source operand from the contents of a 32-bit register ERd (destination operand) and stores the result in the 32-bit register ERd.

Available Registers

ERd: ER0 to ER7

ERs: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States
			1st byte		2nd byte		3rd byte	4th byte	5th byte	6th byte	
Immediate	SUB.L	#xx:32, ERd	7	A	3	0:erd	IMM				3
Register direct	SUB.L	ERs, ERd	1	A	1:ers	0:erd					1

Notes

2.2.66 SUBS

SUBS (SUBtract with Sign extension)

Subtract Binary Address Data

Operation

Rd – 1 → ERd

Rd – 2 → ERd

Rd – 4 → ERd

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	—	—	—	—

Assembly-Language Format

SUBS #1, ERd

SUBS #2, ERd

SUBS #4, ERd

H: Previous value remains unchanged.

N: Previous value remains unchanged.

Z: Previous value remains unchanged.

V: Previous value remains unchanged.

C: Previous value remains unchanged.

Operand Size

Longword

Description

This instruction subtracts the immediate value 1, 2, or 4 from the contents of a 32-bit register ERd (destination operand). Unlike the SUB instruction, it does not affect the condition-code flags.

Available Registers

ERd: ER0 to ER7

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format						No. of States
			1st byte		2nd byte		3rd byte	4th byte	
Register direct	SUBS	#1, ERd	1	B	0	0	erd		1
Register direct	SUBS	#2, ERd	1	B	8	0	erd		1
Register direct	SUBS	#4, ERd	1	B	9	0	erd		1

Notes

SUBX (SUBtract with eXtend carry)

Subtract with Borrow

Operation

$Rd - (EAs) - C \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	↕	—	↕	↕	↕	↕

Assembly-Language Format

SUBX <EAs>, Rd

Operand Size

Byte

- H: Set to 1 if there is a borrow at bit 3; otherwise cleared to 0.
- N: Set to 1 if the result is negative; otherwise cleared to 0.
- Z: Previous value remains unchanged when the result is zero; otherwise cleared to 0.
- V: Set to 1 if an overflow occurs; otherwise cleared to 0.
- C: Set to 1 if there is a borrow at bit 7; otherwise cleared to 0.

Description

This instruction subtracts the source operand and carry flag from the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd.

Available Registers

Rd: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	SUBX	#xx:8, Rd	B rd	IMM			1
Register direct	SUBX	Rs, Rd	1 E	rs rd			1

Notes

TAS (Test And Set)

Test and Set

Operation

@ERd – 0 → set/clear CCR
 1 → (<bit 7> of @ERd)

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	—

Assembly-Language Format

TAS @ERd

Operand Size

Byte

H: Previous value remains unchanged.
 N: Set to 1 if the result is negative; otherwise cleared to 0.
 Z: Set to 1 if the result is zero; otherwise cleared to 0.
 V: Always cleared to 0.
 C: Previous value remains unchanged.

Description

This instruction tests a memory operand by comparing it with zero, and sets the condition-code register according to the result. Then it sets the most significant bit (bit 7) of the operand to 1.

Available Registers

ERd: ER0, ER1, ER4, ER5

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format								No. of States	
			1st byte		2nd byte		3rd byte		4th byte			
Register indirect	TAS	@ERd	0	1	E	0	7	B	0	erd	C	4

Notes

TRAPA (TRAP Always)

Trap Unconditionally

Operation

- When EXR is invalid
PC → @-SP
CCR → @-SP
<Vector> → PC
- When EXR is valid
PC → @-SP
CCR → @-SP
EXR → @-SP
<Vector> → PC

Condition Code

I	UI	H	U	N	Z	V	C
1	*	—	—	—	—	—	—

- I: Always set to 1.
UI: See note.
H: Previous value remains unchanged.
N: Previous value remains unchanged.
Z: Previous value remains unchanged.
V: Previous value remains unchanged.
C: Previous value remains unchanged.

Assembly-Language Format

TRAPA #x:2

Note: * The UI bit is set to 1 when used as an interrupt mask bit, but retains its previous value when used as a user bit. For details, see the relevant microcontroller hardware manual.

Operand Size

Description

This instruction pushes the program counter (PC) and condition-code register (CCR) onto the stack, then sets the I bit to 1. If the extended control register (EXR) is valid, EXR is also saved onto the stack, but bits I2 to I0 are not modified. Next execution branches to a new address given by the contents of the vector address corresponding to the specified vector number. The PC value pushed onto the stack is the starting address of the next instruction after the TRAPA instruction.

#x	Vector Address	
	Normal Mode	Advanced Mode
0	H'0010 to H'0011	H'000020 to H'000023
1	H'0012 to H'0013	H'000024 to H'000027
2	H'0014 to H'0015	H'000028 to H'00002B
3	H'0016 to H'0017	H'00002C to H'00002F

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Register direct	TRAPA	#x:2	5	7	00IMM	0	7*

Note: * Eight states when EXR is valid.

Notes

The stack and vector structure differ between normal mode and advanced mode, and depending on whether EXR is valid or invalid.

2.2.70 (1) XOR (B)

XOR (eXclusive OR logical)

Exclusive Logical OR

Operation

$Rd \oplus (EAs) \rightarrow Rd$

Condition Code

I	UI	H	U	N	Z	V	C
—	—	—	—	↕	↕	0	—

Assembly-Language Format

`XOR.B <EAs>, Rd`

H: Previous value remains unchanged.

N: Set to 1 if the result is negative; otherwise cleared to 0.

Z: Set to 1 if the result is zero; otherwise cleared to 0.

V: Always cleared to 0.

C: Previous value remains unchanged.

Operand Size

Byte

Description

This instruction exclusively ORs the source operand with the contents of an 8-bit register Rd (destination operand) and stores the result in the 8-bit register Rd.

Available Registers

Rd: R0L to R7L, R0H to R7H

Rs: R0L to R7L, R0H to R7H

Operand Format and Number of States Required for Execution

Addressing Mode	Mnemonic	Operands	Instruction Format				No. of States
			1st byte	2nd byte	3rd byte	4th byte	
Immediate	XOR.B	#xx:8, Rd	D	rd	IMM		1
Register direct	XOR.B	Rs, Rd	1	5	rs	rd	1

Notes

(8) Block Transfer Instructions

Mnemonic	Size	Addressing Mode and Instruction Length (Bytes)								Operation	Condition Code						No. of States*1	
		#xx	Rn	@ERn	@(d,ERn)	@-ERn/@ERN+	@aa	@(d,PC)	@aa		I	H	N	Z	V	C	Normal	Advanced
EEPMOV/B	—									4	I							4+2n*2
EEPMOV/W	—									4								4+2n*2

Notes: 1. The number of states is the number of states required for execution when the instruction and its operands are located in on-chip memory.

2. n is the initial setting of R4L or R4.

3. Seven states for saving or restoring two registers, nine states for three registers, or eleven states for four registers.

4. One additional state is required for execution immediately after a MULXU, MULXS, or STMAC instruction. Also, a maximum of three additional states are required for execution of a MULXU instruction within three states after execution of a MAC instruction. For example, if there is a one-state instruction (such as NOP) between a MAC instruction and a MULXU instruction, the MULXU instruction will be two states longer.

5. A maximum of two additional states are required for execution of a MULXS instruction within two states after execution of a MAC instruction.

For example, if there is a one-state instruction (such as NOP) between a MAC instruction and a MULXS instruction, the MULXS instruction will be one state longer.

6. A maximum of three additional states are required for execution of one of these instructions within three states after execution of a MAC instruction.

For example, if there is a one-state instruction (such as NOP) between a MAC instruction and one of these instructions, that instruction will be two states longer.

7. For the H8S/2000 CPU.

8. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

9. These instructions are supported only by the H8S/2600 CPU.

(1) The number of states required for execution of an instruction that transfers data in synchronization with the E clock is variable.

(2) Set to 1 when a carry or borrow occurs at bit 11; otherwise cleared to 0.

(3) Set to 1 when a carry or borrow occurs at bit 27; otherwise cleared to 0.

(4) Retains its previous value when the result is zero; otherwise cleared to 0.

(5) Set to 1 when the divisor is negative; otherwise cleared to 0.

(6) Set to 1 when the divisor is zero; otherwise cleared to 0.

(7) Set to 1 when the quotient is negative; otherwise cleared to 0.

(8) MAC instruction results are indicated in the flags when the STMAC instruction is executed.

(9) One additional state is required for execution when EXR is valid.

2.4 Instruction Code

Notes: 1. These instructions are supported by the H8S/2600 CPU only.

2. Bit 7 of the 4th byte of the MOV.L ERs, @(d:32,ERd) instruction can be either 1 or 0.

3. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

Legend

IMM: Immediate data (2, 3, 8, 16, or 32 bits)

abs: Absolute address (8, 16, 24, or 32 bits)

disp: Displacement (8, 16, or 32 bits)

rs, rd, rn: Register field (4 bits specifying an 8-bit or 16-bit register. The symbols rs, rd, and rn correspond to operand symbols Rs, Rd, and Rn.)

ers, erd, ern, erm: Register field (3 bits specifying an address register or 32-bit register. The symbols ers, erd, ern, and erm correspond to operand symbols ERs, ERd, ERn, and ERm.)

The register fields specify general registers as follows.

Address Register			16-Bit Register		8-Bit Register	
Register Field	General Register	Register Field	General Register	Register Field	General Register	Register
000	ER0	0000	R0	0000	R0H	
001	ER1	0001	R1	0001	R1H	
.	.	.	.	.	.	
111	ER7	0111	R7	0111	R7H	
		1000	E0	1000	R0L	
		1001	E1	1001	R1L	
		.	.	.	.	
		1111	E7	1111	R7L

Note: * The letters "aa" indicate an absolute address field.

2.6 Number of States Required for Instruction Execution

The tables in this section can be used to calculate the number of states required for instruction execution by the CPU. Table 2.5 indicates the number of instruction fetch, data read/write, and other cycles occurring in each instruction. Table 2.4 indicates the number of states required for each cycle, depending on its size. The number of states required for each cycle depends on the product. See the hardware manual named for the relevant product for details. The number of states required for execution of an instruction can be calculated from these two tables as follows:

$$\text{Execution states} = I \times S_I + J \times S_J + K \times S_K + L \times S_L + M \times S_M + N \times S_N$$

Examples: Advanced mode, program code and stack located in external memory, on-chip supporting modules accessed in two states with 8-bit bus width, external devices accessed in three states with one wait state and 16-bit bus width.

1. BSET #0, @FFFC7:8

From table 2.5:

$$I = L = 2, \quad J = K = M = N = 0$$

From table 2.4:

$$S_I = 4, \quad S_L = 2$$

$$\text{Number of states required for execution} = 2 \times 4 + 2 \times 2 = 12$$

2. JSR @@30

From table 2.5:

$$I = J = K = 2, \quad L = M = N = 0$$

From table 2.4:

$$S_I = S_J = S_K = 4$$

$$\text{Number of states required for execution} = 2 \times 4 + 2 \times 4 + 2 \times 4 = 24$$

Table 2.4 Number of States per Cycle

			Access Conditions					
			On-Chip Supporting Module		External Device			
					8-Bit Bus		16-Bit Bus	
					2-State Access	3-State Access	2-State Access	3-State Access
Cycle		On-Chip Memory	8-Bit Bus	16-Bit Bus				
Instruction fetch	S_i	1	2n	n	4	6 + 2m	2	3 + m*
Branch address read	S_j							
Stack operation	S_k							
Byte data access	S_L		n		2	3 + m		
Word data access	S_M		2n		4	6 + 2m		
Internal operation	S_N	1	1	1	1	1	1	1

Note: * For the MOVFPE and MOVTPPE instructions, refer to the relevant microcontroller hardware manual.

Legend

m: Number of wait states inserted into external device access

n: Number of states required for access to an on-chip supporting module. For the specific number, refer to the relevant microcontroller hardware manual.

XORC	XORC #xx:8,CCR	1					
XORC	XORC #xx:8,EXR	2					

Notes: * These instructions are supported by the H8S/2600 CPU only.

1. 2 when EXR is invalid, 3 when EXR is valid.
2. 5 for concatenated execution, 4 otherwise.
3. An internal operation may require between 0 and 3 additional states, depending on the preceding instruction.
4. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

2.7 Bus States During Instruction Execution

Table 2.6 indicates the types of cycles that occur during instruction execution by the CPU. See table 2.4 for the number of states per cycle.

How to Read the Table:

Legend

R:B	Byte-size read
R:W	Word-size read
W:B	Byte-size write
W:W	Word-size write
:M	Transfer of the bus is not performed immediately after this cycle
2nd	Address of 2nd word (3rd and 4th bytes)
3rd	Address of 3rd word (5th and 6th bytes)
4th	Address of 4th word (7th and 8th bytes)
5th	Address of 5th word (9th and 10th bytes)
NEXT	Address of next instruction
EA	Effective address
VEC	Vector address

Figure 2.1 shows timing waveforms for the address bus and the $\overline{RD}$ and $\overline{WR}$ ($\overline{HWR}$ or $\overline{LWR}$) signals during execution of the above instruction with an 8-bit bus, using three-state access with no wait states.

Figure 2.1 Address Bus, $\overline{RD}$, and $\overline{WR}$ ($\overline{HWR}$ or $\overline{LWR}$) Timing (8-Bit Bus, Three-State Access, No Wait States)

Notes: * These instructions are supported by the H8S/2600 CPU only.

1. EAs is the contents of ER5. EAd is the contents of ER6.
2. EAs is the contents of ER5. EAd is the contents of ER6. Both registers are incremented by 1 after execution of the instruction. n is the initial value of R4L or R4. If n = 0, these bus cycles are not executed.
3. Repeated two times to save or restore two registers, three times for three registers, or four times for four registers.
4. For the number of states required for byte-size read or write, refer to the relevant microcontroller hardware manual.
5. Start address after return.
6. Start address of the program.
7. Prefetch address, equal to two plus the PC value pushed onto the stack. In recovery from sleep mode or software standby mode the read operation is replaced by an internal operation.
8. Start address of the interrupt-handling routine.
9. An internal operation may require between 0 and 3 additional states, depending on the preceding instruction.
10. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

2.8 Condition Code Modification

This section indicates the effect of each CPU instruction on the condition code. The notation used in the table is defined below.

$$m = \begin{cases} 31 & \text{for longword operands} \\ 15 & \text{for word operands} \\ 7 & \text{for byte operands} \end{cases}$$

S_i The i -th bit of the source operand

D_i The i -th bit of the destination operand

R_i The i -th bit of the result

D_n The specified bit in the destination operand

— Not affected

$\updownarrow$ Modified according to the result of the instruction (see definition)

0 Always cleared to 0

1 Always set to 1

*

Undetermined (no guaranteed value)

Z' Z flag before instruction execution

C' C flag before instruction execution

Section 3 Processing States

3.1 Overview

The CPU has five main processing states: the reset state, exception handling state, program execution state, bus-released state, and power-down state. Figure 3.1 shows a diagram of the processing states. Figure 3.2 indicates the state transitions.

Figure 3.1 Processing States

3.3 Exception-Handling State

The exception-handling state is a transient state that occurs when the CPU alters the normal processing flow due to a reset, interrupt, or trap instruction. The CPU fetches a start address (vector) from the exception vector table and branches to that address.

3.3.1 Types of Exception Handling and Their Priority

Exception handling is performed for traces, resets, interrupts, and trap instructions. Table 3.1 indicates the types of exception handling and their priority. Trap instruction exception handling is always accepted, in the program execution state.

Exception handling and the stack structure differ according to the interrupt control mode set in SYSCR.

Table 3.1 Exception Handling Types and Priority

Priority	Type of Exception	Detection Timing	Start of Exception Handling
High	Reset	Synchronized with clock	Exception handling starts immediately when RES changes from low to high
	Trace	End of instruction execution or end of exception-handling sequence* ¹	When the trace (T) bit is set to 1, the trace starts at the end of the current instruction or current exception-handling sequence
	Interrupt	End of instruction execution or end of exception-handling sequence* ²	When an interrupt is requested, exception handling starts at the end of the current instruction or current exception-handling sequence
Low	Trap instruction	When TRAPA instruction is executed	Exception handling starts when a trap (TRAPA) instruction is executed* ³

Notes: 1. Traces are enabled only in interrupt control modes 2 and 3. Trace exception-handling is not executed at the end of the RTE instruction.
2. Interrupts are not detected at the end of the ANDC, ORC, XORC, and LDC instructions, or immediately after reset exception handling.
3. Trap instruction exception handling is always accepted, in the program execution state.

For details on interrupt control modes, exception sources, and exception handling, refer to the relevant microcontroller hardware manual.

3.3.2 Reset Exception Handling

After the $\overline{\text{RES}}$ pin has gone low and the reset state has been entered, reset exception handling starts when RES goes high again. When reset exception handling starts the CPU fetches a start address (vector) from the exception vector table and starts program execution from that address. All interrupts, including NMI, are disabled during reset exception handling and after it ends.

3.3.3 Trace

Traces are enabled only in interrupt control modes 2 and 3. Trace mode is entered when the T bit of EXR is set to 1. When trace mode is established, trace exception handling starts at the end of each instruction.

At the end of a trace exception-handling sequence, the T bit of EXR is cleared to 0 and trace mode is cleared. Interrupt masks are not affected.

The T bit saved on the stack retains its value of 1, and when the RTE instruction is executed to return from the trace exception-handling routine, trace mode is entered again. Trace exception-handling is not executed at the end of the RTE instruction.

Trace mode is not entered in interrupt control modes 0 and 1, regardless of the state of the T bit.

3.3.4 Interrupt Exception Handling and Trap Instruction Exception Handling

When interrupt or trap-instruction exception handling begins, the CPU references the stack pointer (ER7) and pushes the program counter and other control registers onto the stack. Next, the CPU alters the settings of the interrupt mask bits in the control registers. Then the CPU fetches a start address (vector) from the exception vector table and execution branches to that address.

Figure 3.3 shows the stack after exception handling ends, for the case of interrupt mode 1 in advanced mode.

Normal mode

(a) Interrupt control modes 0 & 1

(b) Interrupt control modes 2 & 3

Advanced mode

(c) Interrupt control modes 0 & 1

(d) Interrupt control modes 2 & 3

Note: * Ignored when returning.

Figure 3.3 Stack Structure after Exception Handling (Example)

3.4 Program Execution State

In this state the CPU executes program instructions in sequence.

3.5 Bus-Released State

This is a state in which the bus has been released in response to a bus request from a bus master other than the CPU. While the bus is released, the CPU halts except for internal operations.

Bus masters other than the CPU may include the direct memory access controller (DMAC) and data transfer controller (DTC).

For further details, refer to the relevant microcontroller hardware manual.

3.6 Power-Down State

The power-down state includes both modes in which the CPU stops operating and modes in which the CPU does not stop. There are three modes in which the CPU stops operating: sleep mode, software standby mode, and hardware standby mode. There are also two other power-down modes: medium-speed mode and module stop mode. In medium-speed mode the CPU and other bus masters operate on a medium-speed clock. Module stop mode permits halting of the operation of individual modules, other than the CPU. For details, refer to the relevant microcontroller hardware manual.

3.6.1 Sleep Mode

A transition to sleep mode is made if the SLEEP instruction is executed while the software standby bit (SSBY) in the system control register (SYSCR) is cleared to 0. In sleep mode, CPU operations stop immediately after execution of the SLEEP instruction. The contents of CPU registers are retained.

3.6.2 Software Standby Mode

A transition to software standby mode is made if the SLEEP instruction is executed while the SSBY bit in SYSCR is set to 1. In software standby mode, the CPU and clock halt and all on-chip operations stop. The on-chip supporting modules are reset, but as long as a specified voltage is supplied, the contents of CPU registers and on-chip RAM are retained. The I/O ports also remain in their existing states.

3.6.3 Hardware Standby Mode

A transition to hardware standby mode is made when the $\overline{\text{STBY}}$ pin goes low. In hardware standby mode, the CPU and clock halt and all on-chip operations stop. The on-chip supporting modules are reset, but as long as a specified voltage is supplied, on-chip RAM contents are retained.

Section 4 Basic Timing

4.1 Overview

The CPU is driven by a system clock, denoted by the symbol ϕ . The period from one rising edge of ϕ to the next is referred to as a “state.” The memory cycle or bus cycle consists of one, two, or three states. Different methods are used to access on-chip memory, on-chip supporting modules, and the external address space. Refer to the relevant microcontroller hardware manual for details.

4.2 On-Chip Memory (ROM, RAM)

On-chip memory is accessed in one state. The data bus is 16 bits wide, permitting both byte and word access. Figure 4.1 shows the on-chip memory access cycle. Figure 4.2 shows the pin states.

Figure 4.1 On-Chip Memory Access Cycle

Figure 4.2 Pin States during On-Chip Memory Access

4.3 On-Chip Supporting Module Access Timing

The on-chip supporting modules are accessed in two states. The data bus is either 8 bits or 16 bits wide, depending on the particular on-chip register being accessed. Figure 4.3 shows the access timing for the on-chip supporting modules. Figure 4.4 shows the pin states.

Figure 4.3 On-Chip Supporting Module Access Timing

Figure 4.4 Pin States during On-Chip Supporting Module Access

4.4 External Address Space Access Timing

The external address space is accessed with an 8-bit or 16-bit data bus width in a two-state or three-state bus cycle. Figure 4.5 shows the read timing for two-state and three-state access. Figure 4.6 shows the write timing for two-state and three-state access. In three-state access, wait states can be inserted. For further details, refer to the relevant microcontroller hardware manual.
