- OFF STATE OPEN LOAD DETECTION
- SHORTED LOAD PROTECTION
- UNDervoltage AND OVERVOLTAGE SHUTDOWN
- LOSS OF GROUND PROTECTION
- VERY LOW STAND-BY CURRENT
- REVERSE BATTERY PROTECTION (\*\*)

### DESCRIPTION

The VND830MSP is a monolithic device designed in STMicroelectronics VIPower m0-3 Technology, intended for driving any kind of load with one side connected to ground. Active  $V_{CC}$  pin voltage clamp protects the device against low energy spikes (see ISO7637 transient

compatibility table). Active current limitation combined with thermal shutdown and automatic restart protects the device against overload. The device detects open load condition both in on and off state. Output shorted to  $V_{CC}$  is detected in the off state. The openload threshold is aimed at detecting the 5W/12V standard bulb as an openload fault in the on state. Device automatically turns off in case of ground pin disconnection.

### ELECTRICAL CHARACTERISTICS (continued)

#### $V_{CC}$ - OUTPUT DIODE

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$V_F$	Forward on Voltage	$-I_{OUT}=1.3A; T_j=150^\circ C$			0.6	V

#### STATUS PIN

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$V_{STAT}$	Status Low Output Voltage	$I_{STAT}=1.6\text{ mA}$			0.5	V
$I_{LSTAT}$	Status Leakage Current	Normal Operation; $V_{STAT}=5V$			10	$\mu A$
$C_{STAT}$	Status Pin Input Capacitance	Normal Operation; $V_{STAT}=5V$			100	pF
$V_{SCL}$	Status Clamp Voltage	$I_{STAT}=1\text{ mA}$ $I_{STAT}=-1\text{ mA}$	6	6.8 -0.7	8	V V

#### PROTECTIONS (see note 1)

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$T_{TSD}$	Shut-down Temperature		150	175	200	$^\circ C$
$T_R$	Reset Temperature		135			$^\circ C$
$T_{hyst}$	Thermal Hysteresis		7	15		$^\circ C$
$t_{SDL}$	Status Delay in Overload Conditions	$T_j > T_{TSD}$			20	$\mu s$
$I_{lim}$	Current limitation	$V_{CC}=13V$ $5.5V < V_{CC} < 36V$	6	9	15 15	A A
$V_{demag}$	Turn-off Output Clamp Voltage	$I_{OUT}=2A; L=6mH$	$V_{CC}-41$	$V_{CC}-48$	$V_{CC}-55$	V

Note 1: To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

#### OPENLOAD DETECTION

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$I_{OL}$	Openload ON State Detection Threshold	$V_{IN}=5V$	0.6	0.9	1.2	A
$t_{DOL(on)}$	Openload ON State Detection Delay	$I_{OUT}=0A$			200	$\mu s$

## VND830MSP

### APPLICATION SCHEMATIC

#### GND PROTECTION NETWORK AGAINST REVERSE BATTERY

Solution 1: Resistor in the ground line ( $R_{GND}$  only). This can be used with any type of load.

The following is an indication on how to dimension the  $R_{GND}$  resistor.

- 1)  $R_{GND} \leq 600\text{mV} / I_{S(on)\text{max}}$ .
- 2)  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power Dissipation in  $R_{GND}$  (when  $V_{CC} < 0$ : during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)\text{max}}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the  $R_{GND}$  will produce a shift ( $I_{S(on)\text{max}} * R_{GND}$ ) in the input thresholds and the status output values. This shift will vary

depending on how many devices are ON in the case of several high side drivers sharing the same  $R_{GND}$ .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see below).

Solution 2: A diode ( $D_{GND}$ ) in the ground line.

A resistor ( $R_{GND}=1\text{k}\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device will be driving an inductive load.

This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network will produce a shift ( $\approx 600\text{mV}$ ) in the input threshold and the status output values if the microprocessor ground is not common with the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

## LOAD DUMP PROTECTION

$D_{ld}$  is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds  $V_{CC}$  max DC rating. The same applies if the device will be subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO T/R 7637/1 table.

## $\mu$ C I/Os PROTECTION:

If a ground protection network is used and negative transient are present on the  $V_{CC}$  line, the control pins will be pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the  $\mu$ C I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of  $\mu$ C and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of  $\mu$ C I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -100V$  and  $I_{latchup} \geq 20mA$ ;  $V_{OH\mu C} \geq 4.5V$   
 $5k\Omega \leq R_{prot} \leq 65k\Omega$ .

Recommended  $R_{prot}$  value is  $10k\Omega$ .

## OPEN LOAD DETECTION IN OFF STATE

Off state open load detection requires an external pull-up resistor ( $R_{PU}$ ) connected between OUTPUT pin and a positive supply voltage ( $V_{PU}$ ) like the +5V line used to supply the microprocessor.

The external resistor has to be selected according to the following requirements:

- 1) no false open load indication when load is connected:  
in this case we have to avoid  $V_{OUT}$  to be higher than  $V_{OLmin}$ ; this results in the following condition  

$$V_{OUT} = (V_{PU}/(R_L + R_{PU}))R_L < V_{OLmin}$$
- 2) no misdetection when load is disconnected: in this case the  $V_{OUT}$  has to be higher than  $V_{OLmax}$ ; this results in the following condition  $R_{PU} < (V_{PU} - V_{OLmax})/I_{L(off2)}$ .

Because  $I_{s(OFF)}$  may significantly increase if  $V_{out}$  is pulled high (up to several mA), the pull-up resistor  $R_{PU}$  should be connected to a supply that is switched OFF when the module is in standby.

The values of  $V_{OLmin}$ ,  $V_{OLmax}$  and  $I_{L(off2)}$  are available in the Electrical Characteristics section.
